आमुख

भारत का स्वास्थ्य से संबंधित पारिवारिक सामाजिक उपभोग पर राष्ट्रीय प्रतिदर्श सर्वेक्षण (रा.प्र.स.) इस विषय पर प्राथमिक आंकड़ों का महत्त्वपूर्ण स्रोत है। ये सर्वेक्षण स्वास्थ्य क्षेत्र पर प्राथमिक सूचना एकत्रित करते हैं यथा, रूग्णता, बीमारियों के उपचार के साथ उनका स्वरुप, स्वास्थ्य सेवाएँ प्रदान करने में सरकारी तथा निजी सुविधाओं की भूमिका, दवाओं पर व्यय, चिकित्सा परामर्श तथा जांच-पड़ताल, अस्पतालों में भर्ती एवं उसके ऊपर व्यय, मातृत्व एवं प्रसव, बुजुर्गों की स्थिति, आदि।

- 2. स्वास्थ्य पर सर्वेक्षण पूर्व में 1953-54 से शुरू हुए, परंतु पूर्व के सर्वेक्षण अनुसंधानमूलक थे। पूर्ण-पैमाने पर प्रथम सर्वेक्षण 1973-74 में किया गया। वर्ष 1995-96 से लेकर अब तक, चार स्वास्थ्य सर्वेक्षण 1995-96, 2004, 2014 तथा 2017-18 में हुए हैं। यह प्रमुख सूचकांक दस्तावेज़ स्वास्थ्य पर किए गए रा.प्र.स. 75वां दौर (जुलाई 2017 से जून 2018) सर्वेक्षण के दौरान एकत्रित किये गए केंद्रीय प्रतिदर्श आंकड़ों एवं परिवारों से प्राप्त जानकारी पर आधारित है। सर्वेक्षण में संपूर्ण भारत संघ को सम्मिलित करते हुए 1,13,823 परिवारों से आंकड़े संग्रहित किये गए।
- 3. राष्ट्रीय सांख्यिकीय कार्यालय के सर्वेक्षण अभिकल्प एवं अनुसंधान प्रभाग ने सर्वेक्षण संसाधनों को विकसित किया तथा इस प्रमुख सूचकांक दस्तावेज़ को तैयार किया। क्षेत्र कार्य, क्षेत्र संकार्य प्रभाग द्वारा किये गए, जबिक समंक गुणवत्ता आश्वासन प्रभाग द्वारा समंक विधायन एवं सारणीयन कार्य किया गया। सर्वेक्षण से संबंधित विभिन्न कार्यकलापों का समन्वय कार्य, सर्वेक्षण समन्वय प्रभाग (एस.सी.डी.) द्वारा किया गया।
- 4. मैं सर्वेक्षण के विभिन्न चरणों में बहुमूल्य मार्गदर्शन प्रदान करने हेतु राष्ट्रीय प्रतिदर्श सर्वेक्षण के 75वें दौर के कार्य दल एवं राष्ट्रीय सांख्यिकी आयोग (एनएससी) के अध्यक्ष और सदस्यों का अत्यंत आभारी हूँ। मैं इस दस्तावेज़ को तैयार करने में सम्मिलित सभी अधिकारियों के प्रयासों की भी सराहना करता हूं।
- 5. मुझे विश्वास है कि यह दस्तावेज़ योजनाकारों, नीति निर्माताओं, शिक्षाविदों तथा अनुसंधानकर्ताओं के लिए उपयोगी सिद्ध होगा।

FOREWORD

The National Sample Survey (NSS) on social consumption related to health forms a vital source of primary data on the subject for the country. The survey gathers basic information on the health sector like morbidity, profile of ailments including their treatment, role of government and private facilities in providing healthcare, expenditure on medicines, medical consultation, investigation, hospitalisation and expenditure thereon, maternity and childbirth, the condition of the aged, etc.

- 2. NSS survey on health dates back to 1953-54, but the early surveys were exploratory and the first full-scale survey was conducted in 1973-74. From 1995-96 onwards, there have been four health surveys, carried out in 1995-96, 2004, 2014 and 2017-18. This Key Indicator (KI) document is based on the response of the households of the central sample data collected through the survey on health conducted in NSS 75th round (July 2017 to June 2018). The survey covered the entire Indian Union where data were collected from 1, 13,823 households.
- 3. The Survey Design and Research Division of NSO undertook the development of the survey methodology and the preparation of this document. The fieldwork was carried out by the Field Operations Division while the data processing and tabulation work was handled by the Data Quality Assurance Division. The Survey Coordination Division coordinated various activities pertaining to the survey.
- 4. I would like to express my gratitude to the Chairman and members of the Working Group of NSS 75th round and National Statistical Commission for their valuable guidance at various stages of the survey. I would also record here my appreciation for the efforts of the officials of different divisions of NSO involved in the preparation of this document.

5. I hope this document will be useful for planners, policy makers, academicians and

researchers.

New Delhi November, 2019 (Vijay Kumar)

Director General (NSS) National Statistical Office

Table A35	Percentage of fully immunised children in the age-group 0-5 years, by State/UT	A-37
Table A36	Percentage break-up of children aged 0-5 years having received any immunisation by source from which most of the immunisation was received, by State/UT and sector	A-38
Table A37	Distribution of population by gender for each State/UT and sector	A-40

Chapter One

Introduction

1.1 NSS health surveys

- 1.1.1 The first full-scale NSS health survey was conducted in the 28th round of NSS (1973-74). Since the 1990s there have been four health surveys of NSO (erstwhile NSSO): those of the 52nd round (July 1995-June 1996), the 60th round (January 2004-June 2004), the 71st round (January 2014-June 2014), and the 75th round (July 2017-June 2018), on which the present report is based. While all were all-India surveys capable of providing State/UT and national level estimates, the 60th and 71st round surveys were 6-month surveys with a smaller sample size in terms of number of households interviewed as well as villages and urban locations selected for survey.
- 1.1.2 The 75th round (2017-18) survey interviewed a random sample of 1,13,823 households spread over rural and urban areas of every district in the country.

1.2 Objective of the survey

- 1.2.1 Like its predecessors, the 75th round survey was aimed at generating basic quantitative information on the health sector. Determining the prevalence rate at state and national level of general morbidity by age-group and gender, as well as of specific categories of ailment, was a major objective of the survey. Measurement of the extent of use of health services provided by the government was another important task. As in the previous surveys, special emphasis was placed on ailments requiring hospitalisation, that is, treatment as an in-patient of a medical institution. The survey investigated the nature of ailments for which people of various ages were hospitalised, the extent of use of government hospitals, and the expenditure incurred on treatment received from government and private facilities. The break-up of expenditure, as in-patient or otherwise, incurred on various heads was estimated to the extent possible. The relative importance of alternative schools of medicine in providing healthcare was assessed.
- 1.2.2 The survey was also designed to provide estimates of the incidence and nature of prenatal and post-natal care, place of childbirth, and expenditure incurred on childbirth and on maternal care, among women who had experienced pregnancy during the last one year. Further, the proportions of children having received specific immunisations, of fully immunised children, and children who had received no immunisation, were estimated for appropriate age-groups of children aged 0-5 years for the purpose of generating SDG (Sustainable Development Goals) indicators of immunisation status. Finally, as in earlier surveys, a profile of aged persons by living arrangement, economic dependence and mobility was generated from information collected on the population aged 60 or more.

2 Chapter One

1.2.3 For all important parameters, separate estimates were provided for population in each gender, State/UT and sector (rural/urban) combination, and for many parameters, by agegroup as well.

1.3 Comparability with earlier surveys

- 1.3.1 Treatments not administered on medical advice: Up to and including the 60th round (2004) survey, ailments that had not been treated on medical advice were not considered as having been treated at all. Self-medication, use of medicines taken on the advice of persons in chemists' shops, etc. were not considered as medical treatment, and ailments for which only such medication was taken were considered as untreated ailments. In the 2014 survey and the current survey (2017-18), however, all such treatments were considered as medical treatment.
- 1.3.2 *Disabilities*: In the 2004 survey and earlier surveys on health, persons with disabilities were regarded as ailing persons. In the 2014 and 2017-18 survey, pre-existing disabilities were considered as (chronic) ailments provided they were under treatment for a month or more during the reference period, but otherwise were not considered ailments. Disabilities acquired during the last 15 days were, however, included in ailments.
- 1.3.3 Classification of ailments: In the 2014 survey the list of ailments that the survey was expected to identify was made more detailed and comprehensive and in line with the requirements of the Ministry of Health and Family Welfare. A list of 60 ailments was used, compared to the 42-ailment list used in the 2004 survey. The present survey has essentially retained this classification of ailments.
- 1.3.4 Classification of nature of treatment: When information on nature of treatment was collected, the options 'Indian System of Medicine' (including Ayurveda, Unani and Siddha), Homeopathy and 'Yoga or Naturopathy' were provided in the list of responses to enable tabulation of data separately for treatments by different systems of medicine. This too was a feature first introduced in the 2014 survey (NSS 71st round).
- 1.3.5 Re-defining a household to get better data on cost of childbirth: In the 2014 survey each woman who had undergone childbirth during the last one year was, in the interests of more accurate data collection, considered a member of the household which had borne the cost of childbirth, and all information on her pregnancy, including pre-natal and post-natal care, was obtained from this household. This procedure led to difficulties in fieldwork and was therefore not followed in the 2017-18 survey.

1.4 Limitations of the survey

1.4.1 The collection of information on ailments depended on reporting of perceived ailments by the respondents. In case of a small set of important diseases, a medical diagnosis was made a necessary condition for classifying a reported condition as a case of the disease – diphtheria, whooping cough, TB, HIV/AIDS, cancers, diabetes, glaucoma and hypertension. In other cases, the diseases were identified by the respondents themselves, sometimes with the help of the interviewer to whom they reported their symptoms. Thus, possibilities of over-

Introduction 3

reporting, under-reporting and misclassifying ailments were all present. The perception of a physical or mental condition as an ailment and the propensity to consider it important enough to report would vary across individuals and cultures. The results of the survey are naturally influenced by these factors.

1.5 Indicators

The indicators presented here are of the following kinds:

A. Morbidity, hospitalisation, nature and treatment of ailments

Proportion of Persons that Responded as Ailing during a 15-day period (PPRA), separately for

- rural and urban, and each State/UT
- ailing-person characteristics such as gender¹, age-group etc.

Break-up of estimated number of ailments by

- ailment characteristics such as nature of ailment
- treatment characteristics, if treated, such as school of medicine, and nature of healthcare facility (sector and State/UT-wise)

Proportion of persons treated as in-patient (receiving medical treatment as inpatient out of every 1000 person during a 365-day period), by

- rural and urban, and each State/UT
- hospitalised-person characteristics such as gender and age-group

Break-up of number of hospitalised cases (other than childbirth) by

- ailment characteristics such as nature of ailment
- type of hospital (sector and State/UT-wise)
- household expenditure class of hospitalised person

B. Expenditure on healthcare

Average medical expenditure per case of hospitalisation, by

- rural and urban, each State/UT, and gender
- household expenditure class of hospitalised person

Break-up of medical expenditure (hospitalisation cases) by major components, separately for

• rural and urban, gender, type of hospital (sector and State/UT-wise)

Average medical expenditure per treated spell of ailment not involving hospitalisation, by

• rural and urban, each State/UT, and gender

.

¹ Separate estimates for the transgender category cannot be presented because the sample sizes do not permit it. Transgender persons have not been clubbed with either "male" or "female", but included in "all (genders)".

4 Chapter One

- household expenditure class of ailing person
- school of medicine, nature of healthcare facility (sector and State/UT-wise)

C. Childbirth

Average expenditure on childbirth by

- rural and urban, each State/UT
- household expenditure class
- type of hospital
- nature of delivery (normal, caesarean., etc)

Break-up of hospital childbirths by type of hospital

• in each State/UT and sector

Percentage of hospital childbirths involving surgery

• by type of hospital

D. Immunisation

Percentages of children aged 0-5 years received any vaccine and average expenditure on immunization, for

- rural and urban
- boys and girls separately

Percentage of fully immunised children in the age-group 0-5 years for

- rural and urban, each State/UT
- boys and girls separately

E. Condition of the aged

Percentage break-up of persons aged 60 or more by living arrangement, by

• rural and urban, and gender

Percentage break-up of aged persons in different age-groups and genders by state of physical mobility

• age-group and gender

It may please be noted that all the above mentioned indicators are compiled on the basis of the response received from the respondent and not on the basis of any record.

Chapter Two

Details of the Survey

2.1 Geographical coverage and sample size

2.1.1 The survey conducted during July 2017 to June 2018 covered the whole of the Indian Union. It collected data from 5,55,114 households spread over every district of the country. The rural households belonged to 8,077 randomly selected villages and the urban households to 6,181 randomly selected urban blocks.

2.2 Population coverage

2.2.1 The survey coverage excluded (i) foreign nationals (ii) residents of barracks of military and paramilitary forces (iii) convicted prisoners undergoing sentence (iv) inmates of *ashrams*, orphanages, rescue homes and vagrant houses other than residential staff employed there and (v) floating population, that is, persons without any usual place of residence.

2.3 Schedule of enquiry

- 2.3.1 The schedule used for data collection from each surveyed household was named Schedule 25.0 and is included as Appendix D of this document. Apart from basic household characteristics, it recorded age, gender, and other important information for each household member before collecting particulars of illness and healthcare.
- 2.3.2 On health, data were collected under the following broad heads:
 - (a) details of each case of hospitalisation of any household member during the 365 days prior to the date of survey, including expenditure incurred for treatment while in hospital
 - (b) details of all ailments (due to illnesses or injuries) experienced by household members during the 15 days prior to the date of survey, including expenditure incurred for treatment without hospitalisation
 - (c) details of the pregnancy of every female household member aged 15-49 years who was reported to have been pregnant at any time during the last 365 days, covering prenatal care, and of childbirth and post-natal care if applicable, and including expenditure on childbirth
 - (d) details of immunisations received by all children under 6 years of age
 - (e) details of mobility, living arrangement and economic independence of members aged 60 or more.

2.4 Survey design

2.4.1 Details of the survey design are provided in the Sample Design and Estimation Procedure (Appendix C).

Details of the Survey 7

2.5 Population estimates

2.5.1 Like most NSS surveys, this survey used a moving reference period, meaning that different surveyed households reported information for different time points or periods depending on the date of survey. Population estimates, required for deriving rates such as the Proportion of Persons that Responded as Ailing (PPRA), the proportion of persons treated as in-patient, were based on the data collected on household size. For simplicity, the population estimates used for deriving the PPRA were based on the household size as reported (on the date of survey) without adjusting for former members who were reported to have died during the reference period of 15 days preceding the date of survey.

2.5.2 On the other hand, the population estimates used for deriving the proportion of persons treated as in-patient in hospital during a 365-day period were adjusted to include the members who had died during the 365-day reference period. It may be noted that this survey was not specifically designed to estimate number of households and persons but these figures can be used to combine rates and ratios pertaining to different indicators. These are design based estimates used for specific purpose only.

2.6 Estimates by quintile class of household expenditure

2.6.1 In order to study the variation in morbidity, health expenditure, choice of healthcare facility etc. across population at different levels of living, a measure of level of living was derived for each surveyed household based on information collected on its usual monthly consumer expenditure. This allowed estimates to be generated separately for 5 different equal-sized classes of population at different quintile class of household expenditure. These classes were formed separately for rural and urban sectors of India as a whole.

Key Findings

3.0.0.0 This chapter discusses the main findings of the survey under the following heads:

- Morbidity, nature of ailments, treatment seeking behaviour
 - Ailments prevailing during a specified period
 - Hospitalization during a specified period
- Average medical expenditure
 - per spell of ailment experienced
 - per case of hospitalization excluding childbirth cases
- Maternity and childbirth: details of care, place of birth and expenditure
- Population aged 60 and above: living arrangement and mobility
- Immunisation of children

3.1 Proportion of Persons that Responded as Ailing (PPRA) in a 15-day period

3.1.0.1 For any group or domain, for example, the rural male population, proportion of persons that responded as ailing (PPRA) in a 15-day period was defined as the 'estimated number of persons in the population reported ailing' as a proportion of 'estimated total population' obtained on the basis of the survey data. The proportion was expressed as percentage.

PPRA = $100 \times (Estimated no. of persons in population reported as ailing <math>\div Estimated population)$

3.1.1 PPRA by gender and age-group

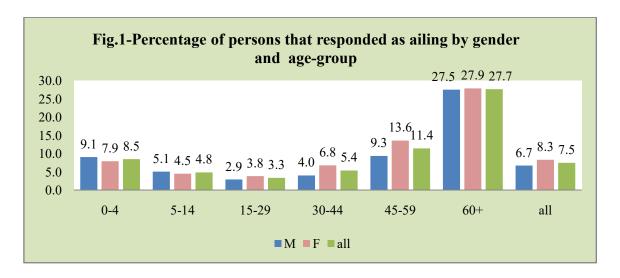

3.1.1.1 Statement 3.1 shows age-specific PPRA for six broad age-groups for male and female at all-India level.

Statement 3.1: PPRA by gender and age-group								
							all-India	
aandan	PPRA (%) in age-group							
gender	0-4	5-14	15-29	30-44	45-59	60+	all	
male	9.1	5.1	2.9	4.0	9.3	27.5	6.7	
female	7.9	4.5	3.8	6.8	13.6	27.9	8.3	
all	8.5	4.8	3.3	5.4	11.4	27.7	7.5	

Table A2, Appendix A

3.1.1.2 Table A2 of Appendix A gives, for the following age-groups:

0-4, 5-9, 10-14, 15-19, 20-24, 25-29, 30-34, 35-39, 40-44, 45-49, 50-59, 60-64, 65-69, 70+ and for the age-groups 60+, 70+ and 80+, the PPRA for the specific age-group for each of the population categories rural, urban and rural-urban combined, and within each of these, separately for male and female.

3.1.1.3 Fig. 1 shows all-India PPRA for six age-groups of population, namely, 0 - 4, 5 - 14, 15 - 29, 30 - 44, 45 - 59 and 60 & above, separately for male, female and persons of any gender.

3.1.2 PPRA by gender and sector

3.1.2.1 Statement 3.2 shows all-India PPRA by gender and sector.

Statement 3.2: PPRA by gender and sector								
all-India								
gaatar	PPRA (percentage of ailing persons)							
sector	male	female	all					
rural	6.1	7.6	6.8					
urban	8.2	10.0	9.1					
all	6.7	8.3	7.5					

Table A2, Appendix A

3.1.3 PPRA: inter-state variation

3.1.3.1 A brief summary of the overall PPRA for the major states, for both sectors and all gender combined, is given in Statement 3.3. Table A1 of Appendix A gives, for each state and UT of India, the PPRA among each of the population categories rural, urban and rural-urban combined, and within each of these, separately for male and female.

Statement 3.3: PPRA in the major states of India						
state	PPRA (%)					
Assam, Bihar	< 3.0					
MP, Karnataka, Chhattisgarh, Rajasthan, Telangana, Haryana	3.0-5.9					
Tamil Nadu, Gujarat, Jharkhand, UP, Maharashtra, Odisha	6.0-9.9					
Punjab, West Bengal, Andhra Pradesh	10.0-14.9					
Kerala	24.5					
all-India	7.5					

Table A1, Appendix A

3.2 Nature of ailments experienced

The schedule of enquiry used for the survey adopted a 60-fold classification of ailments. These have been clubbed into 7 broad categories: (i) infections (including fevers, jaundice, diarrhoea/dysentery), (ii) endocrine or metabolic (including diabetes and thyroid diseases), (iii) cardio-vascular (including hypertension and heart disease) (iv) respiratory, (v) musculo-skeletal (including joint pain, back & body aches), (vi) psychiatric or neurological, and (vii) other ailments. Fig. 2 and Statement 3.4 below show the rural and urban percentage break-ups of ailments by these 7 broad categories of ailment.

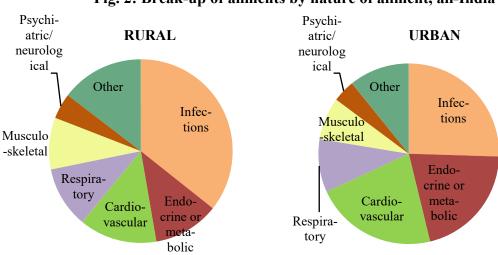

Fig. 2: Break-up of ailments by nature of ailment, all-India

Statement 3.4: Percentage break-up of ailments in rural and urban India by nature of
ailment

rural	35.7	13.8	11.6	10.8	9.1	4.5	14.5	100.0
urban	25.4	21.9	20.8	9.5	7.6	4.0	10.8	100.0

^{*} Upper and lower respiratory infections, however, are classified under "respiratory" ailments. Table A4, Appendix A

3.2.1.1 Table A4 of Appendix A gives the percentage break-up of ailments experienced in India in a 15-day period by nature or type of ailment (7 broad categories), separately for male, female and persons of any gender among rural, urban and rural-urban combined population.

3.3 Treatment of ailments

3.3.1 Treatment seeking behaviour

3.3.1.1 The percentage of ailments treated by allopathy, AYUSH and others at all-India level is shown in statement 3.5. Detailed information on percentage of ailments treated,

separately for male and female, and for rural and urban sectors for allopathy & AYUSH in each state/UT is given in Table A5 and A6, respectively in Appendix A.

Statement 3.5: Percentages of ailments treated by allopathy and AYUSH, all-India percentage of ailments treated by sector **AYUSH** allopathy other female female male all male all male female all 95.1 rural 95.7 95.4 4.2 4.7 4.5 0.1 0.2 0.1 94.7 urban 96.2 95.4 3.6 5.1 4.3 0.2 0.3 0.2 94.9 all 95.9 95.4 4.1 4.8 4.4 0.1 0.3 0.2

Table A5 & A6, Appendix A

3.3.2 Type of healthcare service provider

3.3.2.1 For an ailment treated on medical advice, the term "level of care" was used in the survey to indicate the type of healthcare service provider. Five different types of healthcare service providers were distinguished: (i) government/public hospital (incl. HSC/PHC/CHC etc.), (ii) charitable/trust/NGO-run hospital, (iii) private hospital, (iv) private doctor/clinic, and (v) informal healthcare provider.

3.3.2.2 The break-up of treated ailments by type of healthcare service provider is shown in statement 3.6, separately for rural and urban India. Genderwise information is given in Table A7 of Appendix A. Table A8 of Appendix A gives corresponding break-ups at state/UT level.

Statement 3.6: Percentage break-up of treated ailments by type of healthcare service provider, all-India							
percentage of treated ailments							
healthcare service provider	rural	urban	all				
government/public hospital	32.5	26.2	30.1				
private hospital	20.8	27.3	23.3				
charitable/trust/NGO-run hospital	0.9	1.3	1.1				
private doctor/ in private clinic	41.4	44.3	42.5				
informal health care provider	4.3	0.9	3.0				
all	100.0	100.0	100.0				

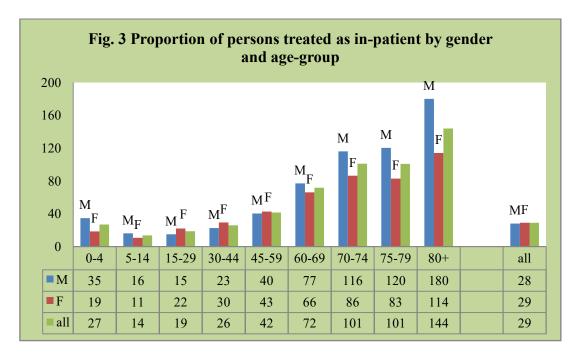

Table A7, Appendix A

3.4 Hospitalisation

3.4.0 The proportion of persons treated as in-patient, defined as the ratio of the estimated number of cases of admission to hospital as in-patient during a 365-day period to the total estimated population, the figure being expressed as a number between 0 and 1000 by multiplying this ratio by 1000 has been computed to have an idea of the overall hospitalisation scenario. However, in the computation of this, cases of admission to hospital for childbirth are excluded.

3.4.1 Proportion of persons treated as in-patient by age-group and gender

3.4.1.1 Fig. 3 shows the variation in the proportion of persons treated as in-patient (excluding childbirth cases) at all-India level across age-groups and genders. The details are given in Table A10 of Appendix A.

3.4.2 Proportion of persons treated as in-patient by age-group and sector

3.4.2.1 The rural-urban variation in proportion of persons treated as in-patient is shown in Statement 3.7. Further details with break-up by gender are given in Table A10 of Appendix A.

Statement 3.7: Proportion of persons treated as in-patient by age-group and sector								
	all-India							
sector	cases o	of hospital	lization (ii	n 365 day	s) per 100	0 populat	ion in age	e-group

Table A10, Appendix A

3.4.3 Proportion of persons treated as in-patient: inter-state variation

3.4.3.1 Statement 3.8 shows the variation among the major states in proportion of persons treated as in-patient. Exact rates for each state/UT, sector and gender are given in Table A9 of Appendix A.

Statement 3.8: Inter-state variation in proportion of persons treated as in-patient hospitalisation cases state per 1000 persons Assam, Bihar, Jharkhand 10-14 Chhattisgarh, MP, UP, Telangana, Gujarat, Rajasthan 20-25 Karnataka, Haryana, Punjab, Maharashtra, Tamil Nadu, Odisha 29-33 Andhra Pradesh, West Bengal 38-42 Kerala 105 29 all-India

Table A9, Appendix A

3.5 In-patient hospitalization cases (excluding childbirth): nature of ailment, type of hospital, source of finance, etc.

3.5.1 Break-up by ailment category

- 3.5.1.1 Statement 3.9 gives the percentage break-up of hospitalisation cases by category of ailment for which the patient was hospitalised, separately for gender and sector.
- 3.5.1.2 In recording information on ailment for which people had been hospitalized during the last 365 days, the same nature-of-ailment classification was adopted as was used for ailments that people reported in response to the question on whether they had suffered from any ailment during the last 15 days.

Statement 3.9: Percentage break-up of ailments for hospitalisation cases

3.5.3 Break-up by quintile class of household expenditure

3.5.3.1 Statement 3.12 shows share of different quintile class of household expenditure in the total number of hospitalisation cases separately for rural and urban India, and also separately for male and female. Table A11 of Appendix A gives, additionally, the shares of the expenditure classes in the total number of hospitalisation cases (rural/urban) for all genders combined.

Statement 3.12: Percentage break-up of hospitalisation cases in India by quintile class of household expenditure, separately for each sector and gender all-India						
quintile class of	0)	% of hospital	lisation case	s		
household expenditure	ru	ral	urban

all	100.0	100.0	100.0	100.0		

Table A11, Appendix A

3.5.4 Break-up by major source of financing of expenditure

3.5.4.1 Households having persons who had been admitted to hospital during the last 365 days were asked about the major source of financing the hospitalization expenses. The

responses were classified into five categories, namely, (i) household income/savings, (ii) borrowings, (iii) sale of physical assets, (iv) contribution from friends and relatives, and (v) other sources. Statement 3.13 shows the estimated percentage break-up of hospitalization cases by major source of finance of hospitalization expenditure. Separate break-ups for different quintile class of household expenditure classes of population are given in Table A14 of Appendix A.

Statement 3.13: Break-up (%) of hospitalization cases by major source of finance of expenses all-India							
sector	% of household income/ savings	f hospitalisati borrow- ings	on cases where contribution from friends & relatives	sale of physical assets	other sources	from all sources	
rural	79.5	13.4	3.4	0.4	3.2	100.0	
urban	83.7	8.5	3.8	0.4	3.4	100.0	

Table A14, Appendix A

3.6 Population covered by health insurance

3.6.1.1 For every member of each surveyed household, it was ascertained whether the person was covered by any scheme for health expenditure support. If so, the broad category of scheme was also recorded. The categories were: government-sponsored (e.g. RSBY, Arogyasri, etc.), government/PSU as an employer (e.g. CGHS, reimbursement from govt. etc.), employer-supported (other than govt./PSU) health protection (e.g. ESIS), insurance arranged by household with insurance companies, and other schemes.

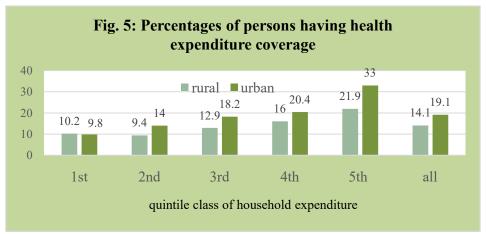

Table A15, Appendix A

3.6.1.3 Statement 3.14 shows the percentage break-up of rural and urban population by type of health expenditure coverage, including those not covered at all.

3.6.1.4 Table A15 of Appendix A gives the percentage break-up separately for rural and urban population, as well as for rural male, rural female, urban male, urban female, separately for population in different quintile class of household expenditure.

Statement 3.14: Percentage break-up of persons by health expenditure coverage type all-India

		% of persons covered by							
sector	% of persons not covered	govt. sponsored insurance scheme	govt./PSU as an employer	employer- supported health protection (other than govt /PSU)	arranged by household with insurance companies	other	all		
rural	85.9	12.9	0.6	0.3	0.2	0.1	100.0		
urban	80.9	8.9	3.3	2.9	3.8	0.2	100.0		

Table A15, Appendix A

3.7 Expenditure on hospitalization

3.7.1 Average medical expenditure during hospital stay by type of hospital

3.7.1.1 Statement 3.15 and Fig. 6 show the average medical expenditure incurred during stay at hospital per case of hospitalisation (excluding childbirth), separately for Government/public hospitals, private hospitals, and all hospitals, including the charitable/NGO/trust-run types. State/UT-wise estimates are available in Table A17 of Appendix A.

3.7.1.2 Medical expenditure, in a case of hospitalisation, was calculated including bed charges, doctor's/surgeon's fees, total amount paid for medicines, diagnostic tests, attendant charges, physiotherapy, personal medical appliances, and blood, oxygen, etc. during stay at the hospital (within the reference period of last 365 days) – whether made available by the

hospital or procured from outside. Expenses on transportation of the patient to or from the hospital were excluded, and so was expenditure on food.

Statement 3.15: Average medical expenditure per hospitalisation case by type of hospital all-India average medical expenditure (Rs.) per case type of hospital rural + urban rural urban government/public 4,290 4,837 4,452 private 27,347 38,822 31,845 all (incl. charitable/NGO/trust-run) 16,676 26,475 20,135

Table A17, Appendix A

3.7.2 Average medical expenditure per hospitalisation case by ailment type

3.7.2.1 Statement 3.16 shows, separately for public, private and all hospitals, the average medical expenditure per case of hospitalisation for selected (broad) categories of ailments.

^{*}including charitable/NGO/trust-run

Table A16, Appendix A

While Statement 3.16 gives estimates for rural and urban sectors combined, separate estimates for rural and urban India are available in Table A16 of Appendix A.

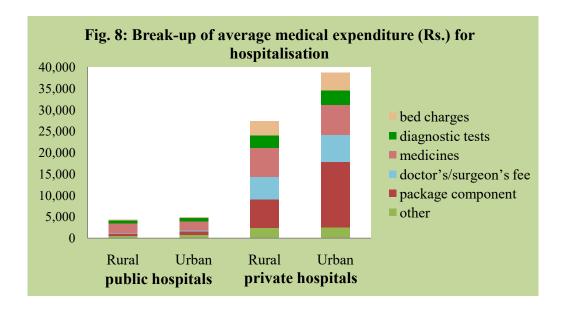

3.7.2.2 Fig. 7 shows the estimates of average medical expenses for all categories of ailment except "infections", as this term covers too broad a category of ailments for the estimated average to be very useful. Note that infections of the respiratory tract are included in "respiratory ailments" and not in "infections".

3.7.3 Break-up of average medical expenditure per hospitalisation case by type of hospital

3.7.3.1 The break-up of average medical expenditure per case across public and private hospitals for different components are shown in Statement 3.17 and Fig. 8. Table A19 of Appendix A gives the break-up of average medical expenditure per case of hospitalisation by its major components, separately for public hospitals, private hospitals and all (including charitable/NGO/trust-run) hospitals in rural and urban sectors, and in India as a whole.

Statement 3.17: Break-up of average medical expenditure (Rs.) for hospitalisation

3.8 Expenditure on treatment of ailments not involving hospitalisation

3.8.1 Average medical expenditure per treated ailment by healthcare service provider

3.8.1.1 Statement 3.20 shows average medical expenditure incurred per spell of ailment not involving admission to hospital, separately for five levels of care: government/public hospitals, charitable/NGO/trust-run hospitals, private hospitals, private doctors or clinics, and informal healthcare providers. Table A23 of Appendix A gives estimates for male and female population separately as well.

Statement 3.20: Average medical expenditure per treated ailment by healthcare service provider

all-India

3.11.3 Main source of immunisation

3.11.3.1 For each child aged 0-5 years, the type of health facility from which the child had received most of the immunisation vaccines, if any, was ascertained. The categories of health facility were: (i) HSC/Anganwadi centre, (ii) PHC/dispensary/CHC/mobile medical unit, (iii) government/public hospital, (iv) charitable or trust/NGO-run hospital, (v) private hospital, and (vi) private doctor/clinic. The percentage break-up of rural and urban children of each state who had received any immunisation by type of health facility reported as the main source of immunisation is shown in Table A36 of Appendix A. Statement 3.34 shows the all-India picture.

Statement 3.34: Percentage break-up of children aged 0-5 years who had received any immunisation by category of health facility reported as the main source of immunisation received all-India

Appendix B

Concepts and Definitions

Concepts and Definitions

ILLNESS AND HOSPITALIZATION

Ailment: Ailment (illness or injury) means any deviation from a person's state of physical and mental well-being. For the purpose of this survey, "ailment" included (a) All types of injuries, such as cuts, wounds, haemorrhage, fractures and burns caused by an accident, including bites to any part of the body (b) Cases of abortion – natural or accidental. Ailments excluded (i) Cases of sterilisation, insertion of IUD, medical termination of pregnancy, etc. (ii) A state of normal pregnancy without complications (iii) Minor skin ailments, minor headaches and bodyaches, and minor gastric discomfort after meals (iv) Cases of pre-existing disabilities, unless a course of treatment of the disability on medical advice for a period of one month or more was continuing as on the date of survey.

Chronic ailment: A chronic ailment existing on the date of survey was identified as an ailment satisfying one of the following criteria I and II. (I) Symptoms of the ailment (subject to the exclusions (i)-(iv) mentioned in the definition of ailment) persisting for more than one month on the date of survey. (II) A course of treatment of the ailment (*no exclusions*), on medical advice, continuing for a month or more on the date of survey.

Spell of ailment: A spell is a continuous period of sickness due to a specific ailment.

Hospitalisation: To be hospitalised means to be *admitted as an in-patient* in a medical institution. A person who underwent surgery in a temporary camp or day care centre was also considered to have been hospitalised for the purposes of this survey.

Case of hospitalisation: Each admission to hospital was counted as a separate hospitalisation case for the purpose of this survey.

HEALTHCARE FACILITIES USED

Level of care: This term is used for the classification of treated ailments by healthcare facility used. The complete level-of-care classification used in the schedule of enquiry was as follows:

Government/public hospital (incl. HSC/PHC/CHC etc.)
Charitable/trust/NGO-run hospital
Private hospital
Private doctor/clinic
Informal healthcare provider

ASHA (Accredited Social Health Activist): ASHAs are local women trained to act as health educators and promoters in their communities. There is one ASHA for every 1000 population. Their tasks include motivating women to give birth in hospitals, bringing children to immunization clinics, encouraging family planning (e.g., usage of condoms, IUDs, surgical sterilization), treating basic illness and injury with first aid, keeping demographic records,

B-2 Appendix B

and improving village sanitation. They have a drug kit – which has tablets like paracetamol, anti-malarials, oral contraceptives, co-trimoxazole (an antibiotic), etc.

AWW (Anganwadi worker): These are the staff of the Anganwadi centre in the village. There is one Anganwadi centre for every 1000 population. These centres provide supplementary nutrition, non-formal pre-school education, nutrition and health education, immunization, health check-up and referral services. They are provided with a drug kit and may give tablets for about 1 to 3 children in a day.

ANM: See HSC.

HSC (Health Sub-Centre): This is the most peripheral facility in the primary health care system. There is one sub-centre for every 3000 population in hilly/tribal/difficult areas and 5000 population in plains. Each Sub-Centre is staffed by one or two Auxiliary Nurse/Midwives (ANM) (female health worker) and may have a male health worker. Their main task (as perceived) is to provide immunization to children and antenatal care. Some subcentres also conduct normal delivery but they have no beds and the Sub-Centre is not considered as an institution with in-patients. They perform some outpatient care largely in the form of treatment for basic illnesses. Any treatment taken from ANM during her visit to the village can be considered as treatment taken at sub-centre.

Dispensary: This is a public institution from which medical supplies, preparations, and treatments are dispensed, but which does not have facilities for treatment of in-patients. Dispensaries are staffed by one or more doctors.

PHC (Primary Health Centre) is staffed by a Medical Officer (MBBS or AYUSH) and paramedical staff. They provide curative OPD services and ante natal checkups and deliveries. They usually have 4-6 beds to conduct delivery. They may or may not have facilities for in-patient treatment. There is one PHC for every 30000 population in the plains and for every 20,000 populations in hilly/tribal/difficult areas. The terms "additional PHC", "mini-PHC" and "new PHC" are considered synonymous with PHC. PHCs in Bihar and Uttar Pradesh are the equivalent of CHCs in other States that their area of coverage is a block and may even have 30 beds. Admissions/in-patients are always there in this facility type. The equivalent of a PHC in these States is called an additional PHC.

CHC (Community Health Centre): CHC is usually located at block/division or *taluk* level and serves as a referral centre for PHCs. It is to be staffed by medical specialists and medical officers and AYUSH doctors – but in practice there are usually only medical officers. It always has provision for in-patients and 10 to 30 beds. It usually has an OT, X-Ray, Labour Room and laboratory facilities.

Public Hospital: All other government hospitals, including district hospitals in the district headquarters town (which acts as referral site for all the CHCs and PHCs and sub-centres), government medical college hospitals, ESI hospitals, other government hospitals like maternity hospitals, cancer hospitals, TB or leprosy hospitals, railway hospitals, etc. run by the government covered under the category 'public hospital' for the purposes of this survey.

Private Hospital, private clinic: Any other hospital/ nursing home/ day care centre with facilities for in-patient treatment is called a private hospital. A private clinic is one with facilities for consultation with private doctor(s) but no in-patient facility.

Medical institution: This includes all HSC, PHC, CHC, public dispensaries with facilities for in-patient treatment, any public hospital (district hospital/state general hospitals/ medical college hospitals etc), and private hospital of any kind (private nursing home, day care centre, private medical college and hospital, super speciality hospital, etc.).

Informal healthcare provider: This term covers a variety of health service providers who are untrained and work outside regulatory frameworks.

NATURE OF TREATMENT

Allopathy: This refers to the broad category of medical practice that is sometimes called Western medicine, biomedicine, evidence-based medicine, or modern medicine. According to MedTerms Dictionary, allopathic medicine is defined as "the system of medical practice which treats disease by the use of remedies which produce effects different from those produced by the disease under treatment".

Indian System of Medicines (ISM): This includes Ayurveda, Siddha, Unani and Sowa-Rig-Pa medicines. These medicines are also called *desidawaiyan* in India. Herbal medicines are also included in this category of medicines. The practitioners of these systems may be called (*jadi-booti wale*) Vaidji, Vaidya, Siddha Vaidya, Hakim, etc. This category also includes home-made medicines and *gharelu nuskhe*, herbal medicines (*jadi-bootiyan or desidawa*), and the medicines given by local Vaidya/Hakim. e.g. *neem* leaves for skin diseases, *tulsi* leaves for common cold, *haldi* (turmeric) for injuries and fracture, *adarak* (ginger) for cough, cold, throat problem etc., *lahasun* (garlic) for *gathiya/* joint pain, *kali mirch* (pepper) and honey for dry and productive cough, *ashwagandha, chyawanprash* as tonic, *rasayana* for energy, *gulabjal* for eye diseases and face wash, *saunf* for indigestion, *ajowain* and *hing* for stomach pain, *methi* seeds, *ajawain*, *pudina* (mint), *jeera*, *sunthi* (dry ginger), *laung* (clove), oil for toothache, *triphala* powder for problems like indigestion, loss of appetite, constipation, *bilva* (*bel*) powder for diarrhoea, etc.

Homoeopathy: Homeopathy is a system of medicine that uses highly diluted doses from the plant, mineral and animal kingdoms to stimulate natural deafness in the body. Oral Homoeopathy medicine is available in many forms, including the traditional homoeopathic pellets (balls), liquid dilution, tablets (lactose-based) and mother tincture.

Yoga and Naturopathy: Yoga is a combination of breathing exercises (pranayam), physical postures (asanas) and meditation for curing illness and releasing stress, both physical and mental. In Naturopathy treatments are based on five elements of nature, namely, (i) Earth (mud baths, mud packs, mud wraps) (ii) Water (hydrotherapy methods like baths, jets, douches, packs, immersions, compresses/fomentations) (iii) Air (breathing exercises, outdoor walking, open-air baths) (iv) Fire (sun baths, magnetized water) (v) Ether (fasting therapy).

B-4 Appendix B

AYUSH: Each letter of the word AYUSH represents a specific system of medicine: A for Ayurveda, Y for Yoga and Naturopathy, U for Unani, S for Siddha, and H for Homeopathy. Thus AYUSH encompasses the Indian System of Medicines, Yoga and Naturopathy, and Homeopathy. Treatment by any of these systems therefore qualified as AYUSH treatment, and medicines used by any of these systems were called AYUSH medicines.

MEDICAL EXPENDITURE

Medical expenditure in a case of hospitalisation: This includes bed charges, doctor's/surgeon's fees, total amount paid for medicines, diagnostic tests, attendant charges, physiotherapy, personal medical appliances, blood, oxygen, etc. during stay at the hospital (within the reference period of last 365 days) – whether made available by the hospital or procured from outside. Expenses on transportation of the patient to or from the hospital are excluded, and so is expenditure on food.

Package component: Packages of treatment involving specific surgical or non-surgical medical procedures, inclusive of different items like operation theatre (OT) charges, OT consumables, medicines, doctor's fees, bed charges, etc. are common nowadays in all private hospitals. (Normally, packages do not include additional diagnostic tests, attendant charges, physiotherapy, personal medical appliances, blood, oxygen, etc.) When expenditure for a hospitalization case involves a package component, the usual break-up of total expenditure by its various components such as bed charges, doctor's/surgeon's fees, etc. will not be available. Therefore, in deriving the break-up of expenditure (aggregate or perhospitalisation-case) by its components, (i) a "package component" has to be shown (ii) the expenditures on the other components get under-estimated to the extent that packages of treatment are a common feature.

expenditure. out-of-pocket Medical medical expenditure, and amount of reimbursement: In cases of both hospitalised and non-hospitalised treatment, some amount of medical expenditure may be reimbursed by employers or by insurance companies (public or private), or by other agencies. In this survey, expenditures were recorded when (and only when) borne initially by the patient's household, whether or not reimbursed later. The amount reimbursed later was also separately recorded. In cases where reimbursement was of the cashless form, the payment (made to hospital or doctor directly by the employer or insurance company) was not recorded by the survey. Thus (i) the estimates of medical expenditure given in this document include expenses reimbursed later, but not expenses that the household did not have to bear even initially (ii) estimates of amount of reimbursement include only the reimbursement that was made later, with the initial payment having been made by the household.

IMMUNISATION

Full immunisation: A child who has received BCG, OPV-1, OPV-2, OPV-3, DPT-1, DPT-2, DPT-3 and measles vaccine is referred to as fully immunised.

BCG: This injection is meant for immunising the child from an attack of tuberculosis, and is usually injected in a single dose at birth or as early as possible before one year of age.

Oral Polio Vaccine (OPV): OPV is generally given as oral liquid and sometimes as injection in 3 or 4 doses at an interval of 4 weeks. The first dose is given at birth or as early as possible within the first 15 days. Booster doses are also given when the child is 16-24 months of age.

DPT vaccine: This is usually injected in 3 doses at an interval of 1-2 months for immunising the child from diphtheria, whooping cough and tetanus. Generally a booster dose is also injected when the child is 16-24 months of age.

DPT/Pentavalent: Pentavalent vaccine contains five antigens, viz., Hepatitis B, Diphtheria + Pertussis + Tetanus (DPT is a trivalent vaccine) and Haemophilus influenza b (Hib) vaccine. Pentavalent vaccination is provided to children at the age of 6, 10 and 14 weeks as primary dose. The vaccine has replaced DPT and Hep B vaccine in the immunization schedule. However, birth doses of Hep B and two booster doses of DPT (at 16-24 months and 5 years of age) continue to be given.

MATERNITY AND CHILDBIRTH

Pre-natal care: This is also known as antenatal care and is a type of preventive healthcare with the goal of providing regular check-ups that allow doctors or midwives to treat and prevent potential health problems throughout the course of the pregnancy while promoting healthy lifestyles that benefit both mother and child. Pre-natal care starts with history-taking and is followed by examination of the woman, which basically includes: recording weight and height, blood test for anaemia, blood pressure measurement, regular abdominal examination, etc. She is also provided with Tetanus Toxoid (TT) immunisation and IFA tablets or syrup along with other treatment in case of complication. As per schedule, the firstpre-natal care check is to be done within 12 weeks, the second check between 14-26 weeks, the third check between 28-34 weeks and the fourth check between 36-40 weeks, but due to unawareness, mobility, distance, etc., the timing of checks may vary.

Post-natal care: The post-natal period is defined as the first six weeks after birth (42 days) and is critical to the health and survival of a mother and her newborn, being the most vulnerable time for both. Lack of care in this time period may result in death or disability as well as missed opportunities to promote healthy behaviours, affecting women, newborns, and children. Ensuring post-natal care within first 24 hours of delivery and subsequent home visits on the 3rd, 7th and 42nd day are the important components of identification and management of emergencies occurring during the post-natal period. Health workers such as ANMs and staff nurses are oriented and trained to tackle problems identified during these visits.

B-6 Appendix B

Abbreviations

Abbreviation	Expanded form
PPRA	Proportion of Persons that Responded as Ailing
ISM	Indian System of Medicines
AYUSH	Ayurveda, Yoga and Naturopathy, Unani, Siddha, and Homeopathy
ASHA	Accredited Social Health Activist
AWW	Anganwadi worker
ANM	Auxiliary Nurse/ Midwife
HSC	Health Sub-Centre
PHC	Primary Health Centre
CHC	Community Health Centre
OPV	Oral Polio Vaccine
DPT	Vaccine for Diphtheria, Pertussis and Tetanus

Appendix C

Sample Design
and
Estimation Procedure

Sample Design and Estimation Procedure

1. Introduction

1.1 The National Sample Survey, set up by the Government of India in 1950 to collect socioeconomic data employing scientific sampling methods, conducted its 75th round during the period July 2017 - June2018. Apart from "Household Social Consumption: Health", two other subjects were covered: "Household Consumer Expenditure" and "Household Social Consumption: Education".

2. Outline of Survey Programme

- 2.1 **Geographical coverage:** The survey covered the whole of the Indian Union, except for those villages in Andaman and Nicobar Islands which are difficult to access.
- 2.2 **Period of survey:** The survey period was of one year duration starting on 1^{st} July 2017 and ending on 30^{th} June 2018.
- 2.3 **Schedules of enquiry:** The following schedules of enquiry were canvassed:

Sch.0.0	List of households
Sch.1.0	Household consumer expenditure
Sch.25.0	Household social consumption: health
Sch.25.2	Household social consumption: education

2.4 **Participation of States:** In this round all the States and Union Territories except Andaman & Nicobar Islands, Chandigarh, Dadra & Nagar Haveli and Lakshadweep participated by surveying a matching "State sample" of the same size, or larger than the "Central sample" for their State/UT surveyed by the Central government officials. The sample sizes of the States/UTs relative to the Central sample ("extent of matching") were as shown in the table below.

State/UT	Extent of matching
Nagaland (U)	triple
Andhra Pradesh, Manipur, Telangana, Chhattisgarh	double
Gujarat, Maharashtra (U)	one and a half
Remaining States/ UTs	equal

3. Sample Design

3.1 **Outline of sample design:** A stratified multi-stage design was adopted for the 75th round survey. The first stage units (FSU) were the Census villages (*panchayat* wards for Kerala) in the rural sector and Urban Frame Survey (UFS) blocks in the urban sector. (Henceforth the term "village" will refer to *panchayat* wards in case of Kerala.) The ultimate stage units in both sectors

C-2 Appendix C

were the households. In the case of large FSUs, the selection of two sub-FSUs (hamlet-groups in villages and sub-blocks in UFS blocks) was an intermediate stage of sampling.

3.2 **Sampling Frame for First Stage Units:** For the rural areas, the list of 2011 Census villages constituted the sampling frame. For the urban sector, the list of UFS blocks (UFS 2007-12) was the sampling frame.

3.3Stratification

- 3.3.1 Within each district of a State/UT, two basic strata were formed: (i) a rural stratum comprising all rural areas of the district and (ii) an urban stratum comprising all urban areas of the district. If, however, within the urban areas of a district, there were million-plus cities (towns with population 10 lakhs or more as per Population Census 2011), each such city formed a separate basic urban stratum and the remaining urban area of the district, another basic urban stratum.
- 3.3.2 In the case of rural areas of Nagaland another special stratum was formed within the State consisting of all the villages which were difficult to access.

3.4 Sub-stratification

- 3.4.1 **Rural sector:** If r was the sample size allocated for a rural stratum, the number of sub-strata formed was r/4. The villages within a district as per frame were first arranged in ascending order of population. Then cut-off points were marked off in this list demarcating sub-strata 1 to r/4 in such a way that each sub-stratum comprised a group of villages of the arranged frame and had more or less the same population.
- 3.4.2 **Urban sector:** Each urban stratum was divided into two parts an "affluent part" consisting of UFS blocks identified as "affluent area" and a "non-affluent part" consisting of the remaining UFS blocks within the stratum. Samples were allocated to affluent and non-affluent parts in proportion to the total number of households in the UFS block with double weightage to affluent part. If u was the sample size for an urban stratum, the number of sub-strata formed was u/4. Out of the u/4 sub-strata the stratum nos. "01" and "02" were allotted to the 'affluent area' and the remaining sub-stratum numbers viz., "03", "04" ... were allotted to the non-affluent UFS block. If u/4 was more than 1, two or more sub-strata were formed. This was done by first arranging the towns in ascending order of number of households in the town as per the latest UFS phase. From this arranged frame of UFS blocks of all the towns/ million-plus cities of a stratum, u/4 sub-strata were formed in such a way that each sub-stratum had more or less the same number of households. This procedure was followed separately for affluent and non-affluent parts of the town for allocation of samples.
- 3.5 Total sample size (FSUs): 14300 FSUs were allotted for the central sample at all-India level.
- 3.6 **Allocation of total sample to States and UTs:** The total number of sample FSUs were allocated to the States and UTs in proportion to population as per Census 2011 subject to a minimum sample allocation to each State/UT.

- 3.7 Allocation of State/ UT level sample to rural and urban sectors: State/ UT level sample size was allocated between two sectors in proportion to population as per Census 2011 with 1.5 weightage to urban sector depending on population share. A minimum of 16 FSUs (minimum 8 each for rural and urban sector separately) was allocated to each State/ UT.
- 3.8 **Allocation to strata and sub-strata:** Within each sector of a State/UT, the sample size was allocated to the different strata/sub-strata in proportion to the population as per Census 2011. Allocations at stratum level were adjusted to multiples of 4 with a minimum sample size of 4. Allocation for each sub-stratum was 4.
- 3.9 **Sub-rounds:** The survey period of the round was divided into four sub-rounds of three months' duration each as follows:

sub-round 1: July - September 2017 sub-round 2: October - December 2017 sub-round 3: January - March 2018 sub-round 4: April - June 2018

3.9.1 To ensure uniform spread of sample villages FSUs over the entire period of survey, equal numbers of sample villages/blocks (FSUs) were allotted to each of these four sub-rounds, and attempts were made to survey each of the FSUs during the sub-round to which it was allotted. However, because of the arduous field conditions, this restriction was not strictly enforced in Andaman and Nicobar Islands, Lakshadweep, Ladakh region (Leh and Kargil districts) of Jammu & Kashmir and rural areas of Arunachal Pradesh and Nagaland.

3.10Selection of FSUs

- 3.10.1 For the rural sector, from each sub-stratum, sample villages were selected with Probability Proportional to Size With Replacement (PPSWR), size being the population of the village as per Census 2011.
- 3.10.2 For the urban sector, from each stratum/sub-stratum, FSUs were selected by Probability Proportional to Size With Replacement (PPSWR), size being the number of households of the UFS block.
- 3.10.3 Both rural and urban samples were drawn in the form of two independent sub-samples.

C-4 Appendix C

3.11 Hamlet-group/ sub-block formation and selection

3.11.1 Criterion for hamlet-group/sub-block formation: After identification of the boundaries of the FSU, it was first determined whether listing was to be done in the whole sample FSU or not. In case the population of the selected FSU was found to be 1200 or more, it was divided into a suitable number (say, D) of parts or sub-FSUs of more or less equal population – the parts being called "hamlet-groups" in case of villages and "sub-blocks' in case of urban blocks. D was determined as shown in the table.

approx. present popn.	no. of sub-
of sample FSU	FSUs formed
less than 1200	1*
1200 to 1799	3
1800 to 2399	4
2400 to 2999	5
3000 to 3599	6
and so on	
* 1 EGII C 1	

^{*}no sub-FSUs formed

3.11.2 For rural areas of Himachal Pradesh, Sikkim, Andaman & Nicobar Islands, Uttarakhand (except the four districts Dehradun, Nainital, Hardwar and Udham Singh Nagar), Punch, Rajouri, Udhampur, Reasi, Doda, Kishtwar, Ramban, Ladakh region (Leh and Kargil districts) of Jammu and Kashmir and Idukki district of Kerala, the number of hamlet-groups formed was as follows:

approx. present popn.	no. of hamlet-
of sample village	groups formed
less than 600	1*
600 to 899	3
900 to 1199	4
1200 to 1499	5
1500 to 1799	6
and so on	

^{*}no hamlet-groups

formed

3.11.3 Selection of hamlet-groups/ sub-blocks to form the frame for sampling of households:

Once a large FSU had been divided into the required number of sub-FSUs (hamlet-groups or sub-blocks), two of these sub-FSUs were selected in the following manner – the one with the largest population was purposively selected, and another was randomly selected from the remaining sub-FSUs by Simple Random Sampling (SRS). Listing and selection of the households was done independently in the two selected sub-FSUs.

3.12 Formation of second-stage strata (SSS) and allocation of households for Sch.25.0

3.12.1 Households listed in the selected FSU/sub-FSU were stratified into three second-stage strata (SSS). The composition of the second-stage strata and the numbers of households planned to be surveyed from different SSS were as follows:

		number of households surveyed					
SSS	composition of SSS	in an FSU	in each sub-FSU				
555	composition of 555	without hg/sb	where sub-FSUs				
		formation	were formed				
SSS 1	households having at least one child of age	2	1				
	less than 1 year	2	1				
SSS 2	from the remaining, households with at least						
	one member (including deceased former	4	2				
	member) hospitalised during last 365 days						
SSS 3	other households	2	1				

3.13 **Selection of households:** From each SSS, the sample households were selected by SRSWOR.

4. Estimation Procedure

4.1 Notations

 $s = \text{subscript for } s^{\text{th}} \text{ stratum}$

 $t = \text{subscript for } t^{\text{th}} \text{ sub-stratum}$

m = subscript for sub-sample (m = 1, 2)

 $i = \text{subscript for } i^{\text{th}} \text{ FSU [village } (panchayat \text{ ward}) / \text{ block]}$

d = subscript for a hamlet-group/ sub-block (d = 1, 2)

 $j = \text{subscript for } j^{\text{th}} \text{ second stage stratum in an FSU/hg/sb}$

 $k = \text{subscript for } k^{\text{th}} \text{ sample household within an FSU/ hg/sb}$

D = total number of hg's/sb's formed in the sample FSU

 $D^* = 0$ if D = 1

= (D-1) for FSUs with D > 1

Z = total size of a sub-stratum (sum of sizes for all the FSUs of a sub-stratum)

z = size of sample FSU used for selection.

n = number of sample FSUs surveyed including 'uninhabited' and 'zero cases' but excluding casualty for a particular sub-sample and sub-stratum.

H = total number of households listed in a second-stage stratum of an FSU / hamlet-group or subblock of sample FSU

C-6 Appendix C

h = number of households surveyed in a second-stage stratum of an FSU / hamlet-group or sub-block of sample FSU

x, y = observed value of characteristics x, y under estimation

 \hat{X} , \hat{Y} = estimate of population total X, Y for the characteristics x, y

In terms of the above symbols,

 $y_{stmidjk}$ = observed value of the characteristic y for the k^{th} household of the j^{th} second stage stratum of the d^{th} sub-FSU of the i^{th} FSU belonging to the m^{th} sub-sample for the t^{th} sub-stratum of the s^{th} stratum.

However, for ease of understanding, a few symbols have been suppressed in following paragraphs where they are obvious.

4.2 Estimation (for Sch. 25.0) of aggregates for a specific sub-sample and sub-stratum

4.2.1 Rural/Urban

(i) For j-th second-stage stratum of a sub-stratum:

$$\hat{Y}_{j} = \frac{Z}{n_{j}} \sum_{i=1}^{n_{j}} \frac{1}{z_{i}} \left[\frac{H_{i1j}}{h_{i1j}} \sum_{k=1}^{h_{i1j}} y_{i1jk} + D_{i}^{*} \times \frac{H_{i2j}}{h_{i2j}} \sum_{k=1}^{h_{i2j}} y_{i2jk} \right]$$

(ii) For all second-stage strata combined:

$$\hat{Y} = \sum_{i} \hat{Y}_{j}$$

4.3 Overall estimate of an aggregate for a sub-stratum

Overall estimate for aggregates for a sub-stratum (\hat{Y}_{st}) based on two sub-samples in a sub-stratum is obtained as:

$$\hat{Y}_{st} = \frac{1}{2} \sum_{m=1}^{2} \hat{Y}_{stm}$$

4.4 Overall estimate of an aggregate for a stratum

Overall estimate for a stratum (\hat{Y}_s) is obtained as

$$\hat{Y}_s = \sum_t \hat{Y}_{st}$$

4.5 Overall Estimate of Aggregates at State/UT/all-India level

The overall estimate \hat{Y} at the State/ UT/ all-India level is obtained by summing the stratum estimates \hat{Y}_s over all strata belonging to the State/ UT/ all-India.

4.6 Estimates of Ratios

Let \hat{Y} and \hat{X} be the overall estimates of the aggregates Y and X for two characteristics y and x respectively at the State/UT/ all-India level.

Then the combined ratio estimate (\hat{R}) of the ratio $(R = \frac{Y}{X})$ will be obtained as

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

- 4.7 **Estimates of Error**: The estimated variances of the above estimates will be:
- 4.7.1 For aggregate \hat{Y} :

$$V\hat{a}r(\hat{Y}) = \sum_{s} V\hat{a}r(\hat{Y}_{s}) = \sum_{s} \sum_{t} V\hat{a}r(\hat{Y}_{st})$$

where $V\hat{a}r(\hat{Y}_{st})$ is given by

$$Va\hat{r}(\hat{Y}_{st}) = \frac{1}{4}(\hat{Y}_{st1} - \hat{Y}_{st2})^2$$

where \hat{Y}_{st1} and \hat{Y}_{st2} are the estimates for sub-sample 1 and sub-sample 2 respectively for stratum s and sub-stratum t.

4.7.2 For ratio \hat{R} :

$$\hat{MSE}(\hat{R}) = \frac{1}{4\hat{X}^2} \sum_{s} \sum_{t} \left[\left(\hat{Y}_{st1} - \hat{Y}_{st2} \right)^2 + \hat{R}^2 \left(\hat{X}_{st1} - \hat{X}_{st2} \right)^2 - 2\hat{R} \left(\hat{Y}_{st1} - \hat{Y}_{st2} \right) \left(\hat{X}_{st1} - \hat{X}_{st2} \right) \right]$$

4.7.3 Estimates of Relative Standard Error (RSE):

$$R\hat{S}E(\hat{Y}) = \frac{\sqrt{V\hat{a}r(\hat{Y})}}{\hat{Y}} \times 100$$

$$R\hat{S}E(\hat{R}) = \frac{\sqrt{M\hat{S}E(\hat{R})}}{\hat{R}} \times 100$$

5. Multipliers

The formulae for multipliers (of sample households for Sch. 25.0) at stratum/sub-stratum/second-stage stratum level for a sub-sample are given below:

C-8 Appendix C

formula for multipliers											
hg / sb 1	hg / sb 2										
$\frac{Z_{st}}{n_{stmj}} \times \frac{1}{z_{stmi}} \times \frac{H_{stmi1j}}{h_{stmi1j}}$	$\frac{Z_{st}}{n_{stmj}} \times \frac{1}{z_{stmi}} \times D_{stmi}^* \times \frac{H_{stmi2j}}{h_{stmi2j}}$										
j =	1, 2, 3										

Note:

- (i) For estimating any characteristic for any domain not specifically considered in sample design, indicator variable may be used.
- (ii) Multipliers have to be computed on the basis of information available in the listing schedule irrespective of any misclassification observed between the listing schedule and detailed enquiry schedule.
