A C K N O W L E D G E M E N T

The report has been finalised by J. K. Aikat.

S. Chakravarty, M. Das, K. Sankaranarayanan, M. S. Murty, M. T. Baby and P. C. Kundu were associated in the work relating to the preparation of the report.

Supervision of computing, punching and machine tabulation was entrusted to H. B. Choudhury, A. K. Choudhury and S. Palit; R. Roy and S. N. Das; and N. K. De, F. M. Rao and B. L. Banerjee respectively.

The design of the survey was prepared by the Indian Statistical Institute.

The primary data were collected by the Directorate of the National Sample Survey, Government of India, in all the States except West Bengal and Bombay city in Maharashtra State where the Indian Statistical Institute collected the relevant data.

TABLES WITH NOTES ON CONSUMER EXPENDITURE (PRELIMINARY)

*The report entitled 'Tables with notes on Consumer Expenditure (Preliminary), 17th Round : September 1961-July 1962 was prepared by the Indian Statistical Institute Calcutta. The views contained in the report are not necessarily those of Government of India. **

INTRODUCTION

1.1 The data on household consumer expenditure are being collected in each round of the National Sample Survey (NSS) beginning from the first round which started in October 1950. The tables presented in this report have been generated from block no. 17 (Summary of expenditure by selected items) of Schedule 1.0 : Consumer expenditure for the seventeenth round (September 1961—July 1962). The scope of information is thus limited only to eleven broad groups¹ of items of consumption. A special feature of this report is that it furnishes estimates of consumer expenditure both by levels of monthly household expenditure as well as by levels of monthly per capita expenditure.

1.2 The field work of the seventeenth round started in September 1961 and continued upto July 1962. The survey should have usually covered a period of one year but as the 1961 Post Census Survey (Population and Livestock) which were taken up by the NSS during the sixteenth round extended upto August 1961, the survey period for the seventeenth round was of 11 months duration only. The reference period for collection of data on consumer expenditure was 30 days preceding the date of enquiry. The estimates presented in the report, therefore, broadly relate to the period of one year namely from August 1961 to July 1962.

1.3 The geographical coverage of the survey was the entire Indian Union excluding the Andaman and Nicobar islands, the islands of Amindivi, Laccadive and Minicoy, the North East Frontier Agency and certain disturbed areas of Manipur and Ladakh District of Jammu & Kashmir. Information was collected by interviewing one of the members (usually the head of a household) of the sample households. Altogether 7173 sample households from 3639 sample villages in the rural areas and 5225 sample households from 2237 sample blocks in the urban areas (including 700 sample households from 362 sample blocks in the four big cities of Bombay, Calcutta, Delhi and Madras) were tabulated in this round. The estimates in all the tables are given by 3 independent and interpenetrating sub-samples and also by the combined sample. The usual technique of interpenetrating network of samples (IPNS) had been employed both at the collection and tabulation stages.

1.4 The responsibility for field work rested with the Directorate of National Sample Survey in all states and union territories except in West Bengal and Bombay city, where the collection of data was done by the field staff of the Indian Statistical Institute.

1.5 A broad outline of the sampling design and the method of estimation is given in Appendix I. A facsimile of the schedule of Inquiry is given in Appendix II.

CONCEPTS AND DEFINITIONS

2.1 The concepts and definitions followed in the consumer expenditure Inquiry continued to remain the same as in earlier rounds. Some of the basic concepts and definitions are explained below.

2.2 *Household*.—A household is a group of persons usually living together and taking principal meals from a common kitchen. A boarding house, a hotel or a hostel is treated as a cluster of households, where each individual boarder (with his dependents or guests) forms a separate household. Households maintained and fed directly by government such as those in prisons, police quarters, cantonments, hospitals, asylums and relief camps are, however, excluded from the scope of the survey.

2.3 *Household member*.—Any person who takes principal meals with the household for at least 16 days during a period of 30 days preceding the date of Inquiry is considered to be a member of the household. Such a person may be the head of the household, or a relation or protegee of the head, or an employee or a guest of the household.

2.4 *Household size*.—The number of members (as defined above) in a household gives the household size.

2.5 *Consumer expenditure*.—Consumer expenditure comprises all expenditures incurred by the household exclusively on non-productive domestic account including consumption by pet animals of the household. The expenditure on household enterprises is however excluded from consumer expenditure. Consumption out of homegrown produce is evaluated at ex-farm price². Consumption out of gifts and charities as well as of articles acquired through barter exchanges is evaluated at average local retail price. While consumption out of transfer receipts is included, transfer payments of all kinds (loans, gifts, charities, monetary as well as in kind like grain loan etc.) are excluded. Expenditure on purchase and construction of residential houses are considered to be expenses on capital account and hence are excluded from the consumer expenditure schedule; but the expenses towards maintenance of residential building are included in the consumer expenditure of the household. For collection of data from sample households, monetary value of food articles consumed during the reference period (30 days preceding the date of Inquiry) is taken to represent consumer expenditure on food articles during the period. For non-food articles, in general monetary value of articles acquired during the reference period represents consumer expenditure on the articles during the period.

*The draft report (No. D145) was submitted to the Government of India in October, 1966.

¹Details given in para 3.2.

²This procedure is being followed from ninth round onwards.

EXPLANATORY NOTES ON TABLES

3.1 Two sets of tables are presented in the report. The first set (indicated by series A) contains tables in which estimates are supplied by monthly household expenditure classes. The other set (indicated by series B) gives tables in which estimates are obtained by monthly per capita expenditure classes. In each set, the tables are grouped in the following way according to the nature of information supplied by them :

- (i) tables showing the distribution of sample households,
- (ii) tables showing the percentage distribution of estimated number of households and persons,
- (iii) tables showing the average number of persons per household,
- (iv) tables showing the consumer expenditure in rupees per person for a period of 30 days by items of consumption.
- (v) tables showing consumer expenditure as percentage to total consumer expenditure by items of consumption.

3.2 The items of consumption have been merged into 8 independent groups. These are (1) cereals, (2) cereals and cereal substitutes¹, (3) pulses, (4) milk and milk products, (5) other food items, (6) clothing, (7) fuel and light and (8) other non-food items. The tables also provide information for additional broad groups relating to (i) all food items, (ii) all non-food items and (iii) all items.

3.3 The groups of items of consumption, as presented in the tables are defined here in terms of their constituents.

- (a) *cereals*.—rice, wheat, jowar, bajra, maize, barley, small millets, ragi, Bengal gram and their products.
- (b) *cereals and cereal substitutes*.—cereals and cereal substitutes like tapioca, pea etc.
- (c) *pulses*.—arhar, tur, gram, moong, masur, urd, khesari, pea and other pulses and their products.
- (d) *milk and milk products*.—liquid milk (cow, buffalo, goat and others); milk (condensed, powder etc.); ghee (cow and buffalo); butter; dahi, ghol, lassi, and other milk products.
- (e) *other food items*.—oil, oil seeds and products; vegetables; fruits and nuts; meat, egg and fish; sugar salt; spices; beverages and refreshments and processed food; and pickles, jams and jellies.
- (f) *clothing*.—all items of clothing—cotton (mill-made, handloom, and khaddar), silk, rayon etc. and woollen including items of bedding and upholstery.
- (g) *fuel and light*.—coke, coal, firewood, electricity, gas, dungcake, charcoal, kerosene, candle, matches and other fuel and lighting oil.
- (h) *other non-food items*.—pan, etc. tobacco and products, drugs and intoxicants, amusements and sports, education, medicine, toilets, sundry goods, consumer services, conveyance, ceremonials, rents, consumer taxes, furniture, musical instruments, ornaments, domestic utensils, footwear and other durable and semi-durable goods and their repairing expenses including the maintenance of residential houses.

3.4 Excepting for table (v), all tables in para 3.1 have been provided for each of the states and all-India for both the rural and urban sectors; and for each of the four big cities of Bombay, Calcutta, Delhi and Madras individually and by pooling them. Table (v) which gives the percentage estimates has been supplied for all India and for four big cities (pooled) only.

3.5 The estimates in all the tables of the report have been given by 3 independent and partlywise interpenetrating sub-samples, indicated by s_1 , s_2 & s_3 and also by combined sample, indicated by the notation 'comb'.

3.6 The monthly household expenditure classes by which the tables of A series are represented are as follows:

Serial number	monthly household expenditure classes in rupees
(1)	(2)
1	0— 25
2	25— 50
3	50—100
4	100—150
5	150—300
6	300 & above
7	all classes pooled

¹The old terminology "foodgrains" as used in earlier reports on consumer expenditure has been replaced by "cereals and cereal substitutes" in the present report.

The expenditure classes "0—25", "25—50", stand for "upto 24.99", from "25 to 49.99", respectively.

3.7 The monthly per capita expenditure classes by which the tables of B series are represented are as follows :

monthly per capita expenditure classes in rupees		monthly per capita expenditure classes in rupees	
srl. no.		srl. no.	
(1)	(2)	(1)	(2)
1	0— 8	8	24—28
2	8—11	9	28—34
3	11—13	10	34—43
4	13—15	11	43—55
5	15—18	12	55—75
6	18—21	13	75 & above
7	21—24	14	all classes pooled

The expenditure classes "0-8", "8-11", stand for "upto 7.99", "from 8 to 10.99", respectively.

3.8 The following system has been adopted in numbering the tables. The left hand-most digit stands for the sector to which the tables belong, i.e., 1 for rural sector, 2 for urban sector and 3 for city sector. The digit following the first point indicates the serial number of tables listed in para 3.1 and the digit following the second point, the serial number of states or cities. All India tables are indicated by zero-code following the second point.

SUMMARY OF RESULTS

4.1 The average number of persons per rural household is 5.12 for the country as a whole. It is lowest (4.38) for the state of Madras and highest (5.89) for Assam. In the urban sector, the average household size is 4.65 for all India, the highest size (6.10) being reported by Jammu & Kashmir and the lowest (3.70) by West Bengal.

4.2 The tables on percentage distribution of estimated number of persons by levels of monthly household expenditures (table A-3 series) and by levels of monthly per capita expenditures (table B-3 series) both show that the percentage of persons is concentrated more heavily towards the lower expenditure levels in the rural sector, while in the urban and city sectors, it is concentrated more heavily towards the higher expenditure levels. For example, table A-3 series show that the percentage of persons below the household expenditure of Rs. 50 per month in rural, urban and city sectors are 11.67, 5.98 and 4.32 respectively and the corresponding percentages above the household expenditure of Rs. 300 per month are 7.70, 14.02 and 28.78 respectively. It is also revealed from table B-3 series that the percentage of persons below the per capita expenditure of Rs. 11 per month in rural, urban and city sectors are 15.09, 6.81 and 3.75 per cent respectively and the corresponding percentages above the per capita expenditure of Rs. 75 per month are 1.26, 5.11 and 17.05 per cent respectively.

4.3 The per capita total consumer expenditure for a period of 30 days in rural, urban and city sectors in India are observed to be Rs. 21.63, Rs. 31.20 and Rs. 49.84 respectively. The corresponding expenditure for all food items for these regions taken in order are Rs. 14.90, Rs. 18.73 and Rs. 26.84 respectively although in case of cereals and cereal substitutes they are Rs. 8.69, Rs. 7.24 and Rs. 7.28 respectively.

4.4 The average per capita total consumer expenditure for a period of 30 days in rural areas is highest (Rs. 32.68) in Punjab and lowest (Rs. 17.40) in Orissa and in urban areas it is highest (Rs. 40.15) in Assam and lowest (Rs. 24.47) in Jammu & Kashmir. The behavior of the average per capita expenditure on all food items is almost similar. In rural areas it is highest (Rs. 20.77) in Punjab and lowest (Rs. 12.36) in Orissa and in urban areas, it is highest (Rs. 24.13) in Assam and lowest (Rs. 15.47) in Uttar Pradesh. The highest per capita expenditure for a period of 30 days on cereals and cereal substitutes in the rural sector is reported by Bihar (Rs. 10.00) and the lowest by Maharashtra (Rs. 7.02). In the urban sector the highest expenditure on the same items is also reported by Bihar (Rs. 9.23) and the lowest by Punjab (Rs. 6.28).

4.5 In case of cities the highest per capita expenditure for a period of 30 days is reported by Bombay in respect of food items (Rs. 29.88), non-food items (Rs. 27.50) and all items (Rs. 57.38) and the lowest by Madras in respect of the same items namely, food items (Rs. 21.53), non-food items (Rs. 14.54) and all items (Rs. 36.07).

APPENDIX I

Sampling Design and Method of Estimation

1. A broad outline of the sampling design and estimation procedure as followed in the rural and urban sectors during the seventeenth round is given below.

A. Sampling design for the rural sector

2. *General* : A stratified two stage self-weighted sampling design was adopted in which the first stage units were villages and the second stage units were households from which information was collected.

3. *Stratification* : Excepting for the Union Territories of Manipur and Tripura, the same strata which were formed in the sixteenth round were retained in the seventeenth round. The stratification formed in the sixteenth round was as follows. In each state, contiguous districts having similar crop patterns and population densities were grouped together to form 'regions'. In all 48 such 'regions' were formed in the whole of India. Within a 'region' contiguous tehsils fairly homogeneous with respect to population densities were grouped together to form compact strata such that the rural population of the strata were approximately equal. The number of strata formed in a 'region' was made one eighteenth of the total allocation of sample villages to that 'region'. This was done so because the number of sample villages selected for survey was 18 per stratum. While Manipur constituted a stratum by itself, Tripura had been divided into 5 strata by grouping contiguous sub-divisions. In the whole of rural India 216 strata were thus formed.

4. *Allocation* : A total of 3888 villages were sampled in the rural sector during the seventeenth round. Excluding Manipur and Tripura, the number of villages for the different states remained the same as in the sixteenth round. These sample villages were allocated to the different states on a joint consideration of their rural population, area under food crops and available investigation strength in the NSS Blocks of the States and then rounded off to multiples of 18. Within a state, its allocation was further distributed among the different 'regions' in the proportion to their rural population and the final allocations were rounded off to multiples of 18 to allow for the selection of 3 independent sub-samples of 6 villages from each stratum formed in the region. For Manipur and Tripura the number of sample villages assigned were 18 and 90 respectively. The following table gives the allocation of sample villages and sample blocks by states and cities.

Number of sample units (villages/blocks) allotted for survey by states and cities

states/cities	sample villages	sample blocks
(1)	(2)	(3)
1. Andhra Pradesh	306	180
2. Assam	144	33
3. Bihar	360	108
4. Gujarat	144	108
5. Jammu & Kashmir	414	144
6. Kerala	144	72
7. Madhya Pradesh	342	108
8. Madras	252	216
9. Maharashtra	288	324
10. Mysore	180	108
11. Orissa	180	36
12. Punjab	144	72
13. Rajasthan	162	108
14. Uttar Pradesh	468	288
15. West Bengal	234	216
16. Union Territories	126	116
17. All India	3888	2237
18. Bombay city	X	144
19. Calcutta city	X	90
20. Delhi city	X	68
21. Madras city	X	60
22. All cities	X	362

5. *Selection* : In each state (excepting Tripura) and within each stratum the tehsils were first listed in a serpentine order (without breaking their geographical contiguity) and 6 villages were selected circularly systematically with a random start, constituting one sub-sample for the stratum. Three such sets of 6 villages were thus selected each with a new random start, constituting the three independent sub-samples of the stratum. The three independent sub-samples in a stratum were then assigned to three investigators (one for each investigator) working in the same stratum in order to make these sub-samples party-wise independent. In Tripura, three independent balanced linear systematic samples of 6 villages each were drawn from each stratum after arranging the villages in a stratum in the increasing order of their 1951 census population.

5.1 In case a stratum had a large area, it was divided into smaller groups of contiguous tehsils of roughly equal areas in order to reduce the survey area of an investigator. From each sub-divided stratum, three investigation zones were selected with probability proportional to the number of villages in the zones and with replacement. The field work was restricted to these investigation zones only. A set of 6 villages, constituting one sub-sample, was then selected from each of the three selected investigation zones in the manner described earlier and as usual assigned to each investigator for field work. If the same investigation zone had been selected more than once, as many systematic samples of 6 villages as the number of times it was selected were drawn independently from that investigation zone. In case a sample village was too large for investigation purpose, it was divided into a specified number of groups of hamlets of roughly equal population and one such group of hamlets was selected at random with equal probability. The survey in that village was restricted to the group of hamlets thus selected so as to reduce the work load at the village level. The frame used for selection of villages was generally the village list as per 1951 census excepting for the areas belonging to old Travancore-Cochin in Kerala where the 1957 list of villages was used.

5.2 A linear systematic sample of households was selected from each sample village using the interval supplied (which has been fixed so as to make the design self-weighting for each sub-sample at the state level), after arranging the households in two household size classes '1-4' and '5 & above'. On an average 2 households were expected to be surveyed per village.

6. *Work Programme* : In each stratum, three investigators were posted and the same three investigators worked throughout the survey period each surveying an independent sub-sample of 6 villages. The whole period of the survey, September 1961 to July 1962, was divided into 6 sub-rounds of 8 weeks each. The investigation in a particular sample village was restricted to a particular time period. For example, in case of consumer expenditure survey, the sample villages with order of selection as 2, 3, 3, 6, 4 and 1 were surveyed in sub-rounds 1, 2, 3, 4, 5 & 6 respectively.

7. *Estimation Procedure* : The estimates presented are, in general, estimates of ratios of two characteristics, e.g., per person expenditure on different items of consumption and consumer expenditure expressed as percentage to total consumer expenditure. These estimates have been arrived at by computing in each case the estimates of the totals of the two characteristics involved and then finding their ratio. This procedure is repeated for each sub-sample. The procedure of estimation of total of a characteristic for any sub-sample is explained below.

Let, T = the estimate of the state total of any characteristic.

M_c = the constant multiplier for those strata of the state where interval with code C ($= 0, 1, 2, 3$) has been used.

X_c = sum of the values of the characteristics in all the sample households selected in those strata where interval with code C has been used.

$$\text{then } T = \sum_{c=0}^3 M_c \times X_c$$

B. Sampling design for the urban sector

8. *General* : The sampling design for the urban sector was a stratified two stage one in sector 1 strata (explained later) where the urban blocks were first stage units and the households, the second stage units. In sector 2 strata the design was a stratified three stage one where the towns were the first stage units and the urban blocks and the households, the second and the third stage units respectively.

9. *Stratification* : Within each state the whole of urban area was divided into two strata—stratum 1 (sector 1) consisting of towns and cities each with population 50,000 or more and stratum 2 (sector 2) consisting of the rest of the urban areas. This was done on the basis of 1951 census population except in Tripura where 1961 population figures were used. An exception was made in the case of Maharashtra where Bombay city itself constituted one stratum (sector 0). The other two strata (sector 1 and sector 2) of Maharashtra were formed following the principle described above. In all 35 strata were formed in the whole of the urban sector.

10. *Allocation* : The all India allocation of the sample blocks to the two urban sectors, sector 1 and sector 2, was made approximately in the ratio of 2 : 1, and within each sector the allocation to each state (except Tripura) was made proportion to its urban population in that sector. The final allocation to the states were rounded off to multiples of 18 after taking into account the available investigator strength.

11. *Selection* : In all 2237 blocks were selected from the urban sector. In each stratum of sector 1, three independent sub-samples, each containing one third the allocated number of blocks were selected systematically with independent random starts. The frame for selection was the list of urban blocks prepared by the NSS in the Urban Frame Survey (1960). In each stratum of sector 2, the towns within each 'region' (as formed for the rural sector) were arranged according to their means of livelihood pattern. 3 independent systematic (circular) samples of towns of one third the sample size allocated to the stratum were selected with probability proportional to the number of 1951 census blocks in them (except Tripura where number of 1961 blocks were taken). Within each selected town, the UFS list of blocks, or if that was not available, the 1961 census list of blocks was used and one block was selected at random. In towns for which neither UFS nor 1961 census list of blocks were available at the time of selection, the investigator was asked to select one block at random from each selected town using the 1961 census list of blocks, or if that was not available, from the municipal divisions within the town. The blocks within a stratum and sub-sample were numbered serially starting from 1 according to their order of selection.

11.1 A linear systematic sample of households was selected from each block using the interval and random start supplied for selection of households for consumer expenditure enquiry (the interval being fixed in such a manner that the design is self weighting separately for each state, sector and sub-sample), after arranging the households in two household size classes viz. '1-3' and '4 & above', on an average, two households were expected to be sampled from each block.

11.2 If a block was very large, it was divided into a number of compact identifiable sub-blocks of roughly equal population and one of them was selected at random with equal probability. The survey was confined to the selected sub-block only in order to reduce the work-load.

12. *Work Programme* : In urban sector also the whole period of the survey, September 1961—July 1962, was divided into 6 sub-rounds of 8 weeks each. Each sample block was, however, visited twice in the round at an interval of approximately 6 months according to a given programme.

13. *Estimation Procedure* : The estimates presented for the urban sector are similar to those of the rural sector. The estimates of 'total' of a characteristic for the urban sector are obtained independently for each sub-sample as follows :

Let, T = the estimate of the state total of any characteristic from a particular sub-sample.

M_s = the constant multiplier for the s^{th} sector of the state.

X_s = the total value of the characteristic over all households sampled from the blocks belonging to s^{th} sector of the state.
