THE NATIONAL SAMPLE SURVEY

SEPTEMBER 1961-JULY 1962

NUMBER 150

TABLES WITH NOTES

ACKNOWLEDGEMENT

The report was finalised by Amiyamoy Chatterji.

P. C. Kundu, M. S. Murty, M. T. Baby, A. Roy and S. Barua were associated in the work relating to the preparation of the report.

The design of the survey was prepared by the Indian Statistical Institute.

The primary data were collected by the Directorate of the National Sample Survey, Government of India, in all the States except West Bengal and Bombay City in Maharashtra State where the Indian Statistical Institute collected the relevant data.

THE NATIONAL SAMPLE SURVEY

SEVENTEENTH ROUND : SEPTEMBER 1961—JULY 1962

NUMBER 150

Tables with Notes on Housing Condition

The Report entitled "Tables with Notes on Housing Condition, 17th Round, September 1961—July 1962" was prepared by the Indian Statistical Institute, Calcutta. The views contained in the report are not necessarily those of Government of India*

GHAPTER I

INTRODUCTION

- 1.1 The data on condition of residential housing and facilities enjoyed by the household were being collected by the National Sample Survey (NSS) from seventh through seventeenth round excepting thirteenth and fourteenth rounds. In the seventeenth round the items of information collected were almost same as that of the sixteenth round.
- 1.2 The field work of the seventeenth round commenced from September 1961 and concluded in July 1962. The survey, proposed to cover a period of one year, could not be extended beyond a period of 11 months due to continuance of the enquiry of 1961 Post Census Survey (Population and Livestock) upto August 1961.
- 1.3 Estimates presented in the report, relate to condition of structure, period since built, monthly rent and annual cost of repairs and maintenance and are built from the data on housing condition collected through block 18 of schedule 1.0 (consumer expenditure) and refer to the period September 1961—July 1962 excepting that of cost of repair and maintenance which referred to the period September 1960—July 1961. Tabulation of data on source of drinking water could not be undertaken owing to wrong coding at the field of investigation.
- 1.4 The survey was conducted both in rural and urban areas of the entire Indian Union excluding the islands of Andaman and Nicobar, islands of Amindivi, Laccadive and Minicoy, the North-East Frontier Agency and certain disturbed areas of Manipur and Ladakh district of Jammu and Kashmir.
- 1.5 Altogether 7,173 sample households from 3,639 sample villages in the rural areas and 5,225 sample households from 2,237 sample blocks (including 700 sample households from 362 sample blocks in the four big cities of Bombay, Calcutta, Delhi and Madras) in the urban areas were surveyed in this round.
- 1.6 The estimates presented in this report are given by 3 independent, valid, interpenetrating sub-samples and the usual technique of interpenetrating net work of sub-sample (IPNS) was employed at the collection and tabulation stage of the data.
- 1.7 The responsibility of collecting data rested with the Directorate of the National Sample Survey, Government of India in all states and Union territories excepting West Bengal and Bombay city where the work was entrusted to the field unit of the Indian Statistical Institute.
- 1.8 A broad outline of the sampling design and the method of estimation is given in Appendix II. A facsimile of the schedule of enquiry is given in Appendix III.

CONCEPTS AND DEFINITIONS

- 1.9 The concepts and definitions followed in the enquiry of 'housing condition' in the seventeenth round was the same as that of the sixteenth round which was more or less close to earlier rounds. The items covered in the survey are self-explanatory and concepts and definitions of some of the basic items are given in the following paragraphs.
- 1.10 Dwelling House.—A dwelling house included any structurally separated room or suite of rooms in permanent structure used or intended for habitation by family households and having a separate access to a street or to a common passage or stair way. Detached room or rooms for habitation which were clearly intended to form a part of the dwelling were also counted as a part of the dwelling, where as any dwelling house originally intended for habitation by family households but which was in practice used for non-residential purposes like offices or for other family enterprises were excluded for this enquiry on housing condition.
- from a common kitchen. A boarding house, a hotel or a hostel was treated as a cluster of households, where each individual boarder (with his dependants or guests) formed a separate household. Households maintained and fed directly by government such as those in prisons, poiice quarter, cantonments, hospitals, asylum and relief camps were however, excluded from the scope of the survey.
- during a period of 30 days preceding the date of survey was considered to be a member of the household. Such a person may be the head of the household or a relation or protege of the head or an employee or a guest of the household.

^{*}The draft report (No. D165) was first submitted by the Indian Statistical Institute, Calcutta, to the Government of India in April, 1967. It was revised subsequently and resubmitted in August, 1968.

EXPLANATORY NOTES ON TABLES

- 1.13 Two sets of tables presented in this report are numbered as follows. The tables relating to rural areas are denoted by the digit I and the urban tables by 2 on the left hand side of the decimal and the serial number of tables are denoted by the number on the right hand side of the decimal. Two way classificatory tables are presented, showing percentage estimates with (i) estimated number of all households/persons or (ii) estimated number of households/persons of each classificatory item, (iii) estimate of total amount of estimated monthly rent or total annual cost of repairs and (iv) estimate of total of amount of monthly rent or annual cost of repairs and maintenance by different classificatory items as base.
- 1.14 Households were classified by the average monthly household expenditure as reported in Block 2 against item 5 of schedule 1.0 and not by actual expenditure incurred during the reference month and also by condition of structure 'period since built' and 'monthly rent paid' classes as reported on the date of survey were used.
- 1.15 A brief summary of results are given in the following chapter and the detailed tables are given in Appendix I of the report.

CHAPTER II

SUMMARY OF RESULTS

- 2.1 Some selected results are presented in this chapter from those given in tables of Appendix (I) of the report to give a general idea of the condition of housing for residential purpose in the country. The main factors which determine the condition of housing are (i) the condition of structure viz. excellent, fairly good and need no major repairs and bad, dilapidated and impoverished, (ii) period since built and (iii) monthly rent paid by rented households. Two way distribution of households and persons are given with one of the items above as one classificatory item and monthly household expenditure as the other.
- 2.2 Condition of structure.—Condition of structure of residential houses has been classified as excellent, fairly good and need no major repairs, and bad, dilapidated and impoverished. It is seen from Table (I) that nearly 65 percent of households in rural areas and 59 percent in urban areas lived in houses whose condition of structure was classified as 'fairly good and need no major repairs'. Nearly 28 percent of households in rural areas and 22 percent in urban areas were living in houses classified as 'bad, dilapidated and impoverished' whereas percentage of households residing in houses classified as 'excellent' were 7 percent and 19 percent in rural and urban areas respectively.

Table (I): Percentage distribution of households by condition of structure and monthly household expenditure classes

| 51—200 | 4.41 | 10.52 | 45.43 | 41.43 | 18.06 | 14.96 | 67-90 | 66.91 | |
| 201—500 | 1.28 | 5.74 | 6.61 | 9.03 | 1.76 | 1.81 | 9.65 | 16.58 | |
| 501 & above | 0.19 | 1.36 | 0.62 | 0.68 | 0.12 | 0.13 | 0.93 | 2 · 17 | |
| all classes | 7.24 | 19.37 | 64.88 | 58.89 | 27.88 | 21.74 | 100.00 | 100.00 | |

The table also shows that 45 per cent of households in rural areas and 41 percent in urban areas, residing in house with condition of structure as 'fairly good and need no major repairs' belonged to expenditure class 51-200.

2.3 Percentage distribution of estimated number of persons by condition of structure and monthly household expenditure classes, shown in Table (II), indicate that nearly 66 percent and 60 percent of persons lived in houses classified as 'fairly good etc.' in rural and urban areas respectively. Whereas 26 percent and 20 percent of persons in rural and urban areas respectively lived in 'bad, dilapidated and impoverished' houses as gainst 8 percent in rural areas and 20 percent in urban areas in 'excellent' houses.

TABLE (II): Percentage distribution of persons by condition of structure and monthly household expenditure classes

| 501 & above | | • 1 | 10 | | 1 10 | 0.44 | 2.41 | 1.19 | 1.45 | 0.25 | 0.24 | 1.88 | 4.10 |
| all classes . | | | | 10 | | 7.70 | 20.49 | 66 · 12 | 59.81 | 26.18 | 19.70 | 100.00 | 100.00 |

It futher showep that 47 percent and 50 percent of persons having monthly household expenditure between rupees 51 and 200 lived in houses in 'fairly good etc.' condition in rural and urban areas respectively, whereas percentage of persons living in houses in 'bad, dilapidated and impoverished' houses were 19 and 15 percent in rural and urban areas respectively and 4 and 9 percent in 'excellent' houses in rural and urban areas respectively.

2.4 Age of dwelling.—Data on 'period since built' was collected to determine the age of a residential building. Percentage distribution of households by 'condition of structure' classes and 'period since built' is given in Table (III). It is seen that nearly 11 percent of households in rural area and twice of it in urban area resided in houses which were more recently built i. e, within a period of 2 years from the date of survey. It is also seen that of all households nearly 70 percent in rural areas and 66 percent in urban areas resided in premises which were 7 years or more old in age, out of which nearly 39 percent in rural areas and 40 percent in urban areas were aged 20 years and more. Out of these households nearly 2 percent were 'excellent' 25 percent fairly good etc. and 12 percent 'bad, dilapidated etc.' in rural areas and these were nearly 6 percent, 25 percent and 10 percent respectively in urban areas.

2.5 Table (IV) shows the percentage distribution of persons by 'condition of strucure' classes and 'period since built'. It is seen that of all persons 72 percent in rural areas and 69 percent in urban resided in houses which were built 7 years or earlier, out of which 40 percent in rural areas and a little higher than it in urban areas resided in houses which were built 20 years or earlier from the date of survey. Only 10 percent of persons in rural areas and nearly twice of it in urban areas inhabited houses built more recently i.e. earlier than 2 years from the date of survey. It is also seen that nearly 5 percent of persons residing in premises built 20 years and earlier on the date of survey in rural areas and thrice of it in urban areas occupied houses which were in 'excellent' condition, 40 percent and 32 percent in rural and urban areas respectively in 'fairly good etc.' condition and 15 percent in rural areas and 11 percent in urban areas in houses with 'condition of structure' as 'bad, dilapidated and impoverished'.

2.6. Monthly rent.—Monthly rent paid was collected at the time of survey for households paying rent and average monthly rent were computed for households living in rented houses only. While distinguishing between households living in rented and a not rented house some households which were enjoying a house free

of rent against some service were also classified as rented households and rent was considered as nil. It is seen from Table (V) that only 3 percent of all households in rural areas lived in rented houses as against 47 percent in urban areas. Average monthly rent paid per household living in rented houses in rural area was Rs. 4.39 as against Rs. 13.20 in urban areas. Nearly 75 percent of households living in rented households in rural areas and 68 percent in urban areas having monthly expenditure between 51—200 rupees paid rent at the rate of Rs. 4.35 and Rs. 9.99 per month respectively. In rural areas a little more than 0.5 per cent of households living in rented houses with expenditure class 501 and above are shown to have paid Rs. 2.00 as monthly rent. This low rent paid by households belonging to higher level of monthly expenditure in rural areas is probably due to the fact that such households were allowed to inhabit houses at a nominal rent per month or free of rent against some sort of services, like care-taker of a building or property etc. In urban areas, however, households living in rented houses under the same expenditure class are found to have paid Rs. 52.69 as monthly rent which is a little more than twice the amount paid by households living in rented houses having expenditure class 201—500 rupees.

^{2.7} Percentage distribution of households living in rented houses by monthly rent paid and monthly household expenditure is given in Table (VI). Nearly 91 percent of households living in rented houses in rural areas and 53 percent in urban areas paid less than rupees ten as monthly rent. And 63 percent in rural areas and 40 percent in urban areas of household living in rented houses which paid less than rupees ten per month belonged to expenditure class of rupees 51—200.

Of all households living in rented houses much less than 2 percent in rural areas and nearly 18 percent in urban areas paid monthly rent more than rupees 20. And nearly 7 and 10 percent of households living in rented houses in urban areas paying rent more than rupees 20 belonged to expenditure class 51—200 and 201—500 respectively. Nearly 8 and 29 percent of households living in rented houses in rural and urban areas respectively paid rent between rupees 10 and 20, out of which nearly 5 percent in rural areas and 21 ercent in urban areas had monthly household expenditure at a level rupees 51—200.

APPENDIX II

SAMPLING DESIGN AND METHOD OF ESTIMATION

signification to the signification of the significant to the significa

1. A broad outline of the sampling design and estimation procedure as followed in the rural and urban sectors during the seventeenth round-is given below:

A. Sampling design for the rural sector

- 2. General.—A stratified two stage self-weighted sampling design was adopted in which the first stage units were villages and the second stage units were households from which information was collected.
- 3. Stratification.—Excepting for the Union Territories of Manipur and Tripura, the same strata which were formed in the sixteenth round were retained in the seventeenth round. The stratification done in the sixteenth round was as follows. In each state, contiguous districts having similar crop patterns and population densities were grouped together to form 'regions'. In all 48 such 'regions' were formed in the whole of India. Within a 'region' contiguous tehsils fairly homogeneous with respect to population densities were grouped together to form compact strata such that the rural population of the strata were approximately equal. The number of strata formed in a 'region' was made one-eighteenth of the total allocation of sample villages to that 'region'. This was done so because the number of sample villages selected for survey was 18 per stratum. While Manipur constituted a stratum by itself, Tripura had been devided into 5 strata by grouping contiguous sub-divisions. In the whole of rural India 216 strata were thus formed.
- 4. Allocation.—A total of 3888 villages were sampled in the rural sector during the seventeenth round. Excluding Manipur and Tripura, the number of villages for the different states remained the same as in the sixteenth round. These sample villages were allocated to the different states on a joint consideration of their rural population, area under food crops and available investigation strength in the NSS blocks of the states and then rounded off to multiples of 18. Within a state, its allocation was further distributed among the different 'regions' in the proportion to their rural population and the final allocations were rounded off to multiples of 18 to allow for the selection of 3 independent sub-samples of 6 villages from each stratum formed in the region. For Manipur and Tripura the number of sample villages assigned were 18 and 90 respectively. The following table gives the allocation of sample villages and sample blocks by states and cities.

number of sample units (villages/blocks) allotted for survey by states and cities

^{5.} Selection.—In each state (excepting Tripura) and within each stratum the tehsils were first listed in a surpentine order (without breaking their geographical contiguity) and 6 villages were selected circular systematically with a random start, constituting one subsample for the stratum. Three such sets of 6 villages were thus selected each with a new random start, constituting the three independent sub-samples of the stratum. The three independent sub-samples in a stratum were then assigned to three investigators (one for each investigator) working in the same stratum in order to make these sub-samples party-wise independent. In Tripura, three independent balanced linear systematic samples of 6 villages each were drawn from each stratum after arranging the villages in a stratum in the increasing order of their 1951 census population.

- 5.1 In case a stratum had a large area, it was divided into smaller groups of contiguous tehsils of roughly equal areas in order to reduce the survey area of an investigator. From each sub-divided stratum, three investigation zones were selected with probability proportional to the number of villages in the zones and with replacement. The field work was restricted to these investigation zones only. A set of 6 villages, constituting one sub-sample, was then selected from each of the three selected investigation zones in the manner described earlier and as usual assigned to each investigator for field work. If the same investigation zone had been selected more than once, as many systematic samples of 6 villages as the number of times it was selected, were drawn independently from that investigation zone. In case a sample village was too large for investigation purposes, it was divided into a specified number o groups of hamlets of roughly equal population and one such group of hamlets was selected at random with equal probability. The survey in that village was restricted to the group of hamlets thus selected so as to reduce the work load at the village level. The frame used for selection of villages was generally the villages list as per 1951 census excepting for the areas belonging to old Travancore-Cochin in Kerala where the 1957 list of villages was used.
- 5.2 A linear systematic sample of households was selected from each sample village using the interval supplied (which has been fixed so as to make the design self-weighting for each sub-sample at the state level), after arranging the households in two house hold size classes '1-4' and '5 & above'. On an average 2 households were expected to be surveyed per village.
- 6. Work Programme.—In each stratum, three investigators were posted and the same three investigators worked throughout the survey period each surveying an independent sub-sample of 6 villages. The whole period of the survey, September 1961 to July 1962 was divided into 6 sub-rounds of 8 weeks each. The investigation in a particular sample village was restricted to a particular time period. For example, in case of consumer expenditure survey, the sample villages with order of selection as 2, 5, 3, 6, 4 and 1 were surveyed in sub-rounds 1, 2, 3, 4, 5 & 6 respectively.
- 7. Estimation Procedure.—The estimates presented are, in general, estimates of ratios of two characteristics, e.g., per person expenditure on different items of consumption and consumer expenditure expressed as percentage to total consumer expenditure. These estimates have been arrived at by computing in each case the estimates of the totals of the two characteristics involved and then finding their ratio. This procedure is repeated for each sub-sample. The procedure of estimation of total of a characteristic for any sub-sample is explained below.
 - Let, T=the estimate of the state total of any characteristic.

Mc=the constant multiplier for those strata of the state where interval with code c (=0,1,2,3) has been used.

Xc=sum of the values of the characteristics in all the sample households selected in those strata where interval with code c has been used.

then,
$$T = \sum_{c=0}^{3} M_c X_c$$

B. Sampling design for the urban sector

- 8. General.—The sampling design for the urban sector was a stratified two-stage one in sector 1 strata (explained later) where the urban blocks were first stage units and the households, the second stage units. In sector 2 strata the design was a stratified three stage one where the towns were the first stage units and the urban blocks and the households, the second and the third stage units respectively.
- 9. Stratification.—Within each state the whole of urban area was divided into two strata—stratum 1 (sector 1) consisting of towns and cities each with population 50,000 or more and stratum 2 (sector 2) consisting of the rest of the urban areas. This was done on the basis of 1951 census population except in Tripura where 1961 population figures were used. An exception was made in the case of Maharashtra where Bombay city itself constituted one stratum (sector 0). The other two strata (sector 1 and sector 2) of Maharashtra were formed following the principle described above. In all 35 strata were formed in the whole of the urban sector.
- 10. Allocation.—The all India allocation of the sample blocks to the two urban sectors, sector 1 and sector 2, was made approximately in the ratio of 2:1, and within each sector the allocation to each state (except Tripura) was made in proportion to its urban population in that sector. The final allocation to the states were rounded off to multiples of 18 after taking into account the available investigator strength.
- 11. Selection.—In all 2237 blocks were selected from the urban sector. In each stratum of sector 1, three independent sub-samples, each containing one-third the allocated number of blocks were selected systematically with ir dependent random starts. The frame for selection was the list of urban blocks prepared by the NSS in the Urban Frame Survey (1860). In each stratum of sector 2, the towns within each 'region' (as formed for the rural sector) were arranged according to their means of live-lihood pattern. 3 independent systematic (circular) samples of towns of one-third the sample size allocated to the stratum were selected with probability proportional to the number of 1951 census blocks in them (except Tripura where number of 1961 blocks were taken). Within each selected town, the U.F.S. list of blocks, or if that was not available, the 1961 census list of blocks was used and one block was selected at random. In towns for which neither U.F.S. nor 1961 census list of blocks were available at the time of selection, the investigator was asked to select one block at random from each selected town using the 1961 census list of blocks, or if that was not available, from the municipal divisions within the town. The blocks within a stratum and sub-sample were numbered serially starting from 1 according to their order of selection.
- 11.1. A linear systematic sample of households was selected from each block using the interval and random start supplied for selection of households for consumer expenditure enquiry (the interval being fixed in such a manner that the design is self-weighting separately for each state, sector and sub-sample) after arranging the households in two household size classes viz. '1-3' and '4 & above' on an average, two households were expected to be sampled from each block.
- 11.2 If a block was very large, it was divided into a number of compact identifiable sub-blocks of roughly equal population and one of them was selected at random with equal probability. The survey was confined to the selected sub-block only in order to reduce the work-load.
- 12. Work Programme.—In urban sector also the whole period of the survey, September 1961—July 1962, was divided into 6 sub-rounds of 8 weeks each. Each sample block was, however, visited twice in the round at an interval of approximately 6 months according to a given programme.
- 13. Estimation Procedure.—The estimates presented for the urban sector are similar to those of the rural sector. The estimates of 'total' of a characteristic for the urban sector are obtained independently for each sub-sample as follows:
- Let, T=the estimate of the state total of any characteristic from a particular sub-sample.

Ms=the constant multiplier for the sth sector of the state.

Xs=the total value of the characteristic over all households sampled from the blocks belonging to sth sector of the state.

Then, T= Ms X
