ACKNOWLEDGEMENT

1. The report was finalised by Shri S. Bhaskaran Pillai and Sarvashri V. Raja Gopala Sarma. Nirmal Kanti Das Gupta, N. C. Pramanick, S. C. Basu Roy, Kailash Prasad and Asoke Das Gupta were associated in the work relating to the preparation of the report.
2. Supervision of computing, punching and machine tabulation was entrusted to Sarvashri Sukomal Das, Shyam Bose, S. Palit, A. K. Chaudhury, A. K. Ghosal, R. Roy, S. N. Das, P. Mukherjee, K. C. Poddar, B. L. Banerjee and Subir Gupta.
3. The design of the survey was prepared by the Indian Statistical Institute.
4. The primary data were collected by the Directorate of the National Sample Survey, Government of India, in all the states except West Bengal and Bombay city in Maharashtra State where the Indian Statistical Institute collected the relevant data.

SEVENTEENTH ROUND : JULY 1961—JUNE 1962

NUMBER 106

TABLES WITH NOTES ON LAND UTILISATION SURVEY AND CROP-CUTTING EXPERIMENTS

*This report entitled 'Tables with Notes on Land Utilisation Survey and Crop-cutting Experiments, Seventeenth Round, July 1961—June 1962' was prepared by the Indian Statistical Institute, Calcutta. The views contained in the report are not necessarily those of the Government of India.**

CHAPTER ONE

INTRODUCTION

1.1. The land utilisation survey and crop-cutting experiments were continued in the 17th round of NSS (1961-62) to obtain the estimates of production of the seven major cereal crops (rice, jowar, bajra, ragi, maize, wheat and barley) taken together at all-India level. Data on land utilisation were collected by actual observation of the utilisation of the selected plots and the data on yield of crop were collected by harvesting a circular area of radius 4' in selected plots.

1.2. *Geographical coverage :* The survey was carried out in the whole of rural India excluding Andaman and Nicobar Islands, Laccadive, Minicoy and Aminivi Islands, Ladakh district of Jammu and Kashmir, and certain areas of Manipur and North-East Frontier Agency.

1.3. The survey was started in July 1961 and ended in June 1962.

1.4. *Scope of the survey :* The survey covered only crops of autumn, winter and spring seasons of the agricultural year 1961-62. Summer season was not covered. The results given in this note do not, therefore, cover summer crops.

1.5. *Number of villages planned and number surveyed :* The number of villages planned and number surveyed for land utilisation and for crop-cutting experiments are given in Table (1.1). Villages belonging to sub-sample 3 were surveyed only for winter and spring seasons.

*The draft report (No. D. 124) was submitted to the Government of India in January 1964.

N.B. Villages of sub-sample 3 were not planned to be surveyed for autumn season.

CHAPTER Two

SAMPLING DESIGN, CONCEPTS AND DEFINITIONS

2.1. For the land utilisation survey, a stratified two-stage sampling design with three independent and interpenetrating network of sub-samples (IPNS) was adopted, with villages as first-stage units, and clusters of plots as second-stage units. The design for the crop-cutting experiments was a multi-stage one where villages, clusters of plots, sub-plots growing the specified crops and circular area of radius 4' were the successive sampling units.

2.2. *Stratification* : The strata formed for 16th round National Sample Survey were retained for the 17th round also, except in the case of Manipur and Tripura. Manipur was considered as one stratum and Tripura was divided into five strata, by grouping together contiguous sub-divisions. For the purpose of stratification 48 regions were formed in the whole of India by grouping together contiguous districts in each state having similar crop pattern and population density. These were formed in consultation with the Ministry of Food and Agriculture, Government of India, and the State Statistical Bureaus. Within a region, contiguous tehsils fairly homogeneous with respect to population density were grouped together to form compact strata, such that the rural population of the strata were approximately equal. The number of strata formed in a region was one-eighteenth of the allocated number of sample villages in that region. There were altogether 216 strata.

2.3. *Allocation of sample villages to states and regions* : The total number of sample villages for socio-economic and land utilisation surveys (3888) was allocated to the different states on a joint consideration of their rural populations (1951 census) and area under food crops (in 1954-55) except in the case of Tripura, and Jammu and Kashmir. The available strength of investigating staff was also taken into account in finalising the allocations which were ultimately rounded off to multiples of 18. Within a state, its allocation was further distributed among the different regions in proportion to their rural population and in multiples of 18. For Tripura, and Jammu and Kashmir the allocation was 18 times the number of investigators available in the states.

2.4. *Selection of sample villages* : The sampling frame was the list of villages as per 1951 census. In each stratum, three independent sub-samples of 6 villages each (having orders of selection 1 to 6) were selected circularly systematically with three independent random starts after arranging the tehsils in order of their geographical nearness. In Tripura, from each stratum, three independent balanced linear systematic samples of 6 villages each were drawn after arranging the villages in a stratum in the increasing order of their 1951 census populations. The sample village selected for price enquiry was given order of selection 7. In sub-samples 1 and 2, area survey was carried out in villages 2 to 7 and in sub-sample 3

National Sample Survey

in villages 1 to 6. Crop-cutting was conducted in villages 3 and 7 in sub-samples 1 and 2 and in 3 and 6 in sub-sample 3. Villages belonging to sub-sample 3 were not planned to be surveyed in autumn season.

2.5. *Selection of sample plots*: In each sample village, selected for area survey only, 8 clusters of 5 plots each (or 8 clusters of 2 plots each in difficult areas) were selected, while in villages selected for both area survey and crop-cutting, 6 clusters of 10 plots each (or 6 clusters of 5 plots each in difficult areas) were selected. The clusters of plots were selected systematically with equal probability through basic plots, using the village map or a list of plots in the village. When neither the village map nor the list of plots was available, a sample of 4 households (or 2 in difficult areas) was selected in villages selected for area survey only and 6 households (or 3 in difficult areas) in villages selected for both area survey and crop-cutting. The households were selected systematically with equal probability from a list of all the households in the sample village. All the plots possessed by each of the sample households were surveyed. The same set of plots or households were surveyed in each of the seasons for land utilisation. In villages selected for crop-cutting, 6 fields (sub-plots) were selected in each season from a list of fields growing the specified crops of the season prepared from the plots selected for land utilisation survey. The 6 fields to be selected were first allocated to the different specified cereal crops in proportion to the total gross area under the crop in the frame so that at least one field was assigned to each crop. The number of fields so allocated to a crop was selected systematically with probability proportional to gross area under the crop.

2.6. *Location of sample cuts*: The ultimate sampling unit for crop-cutting was a circular area of radius 4'. In the field selected for crop-cutting the centre of the circle was located at random. From fields growing paddy, ragi, wheat (pure) and barley (pure), corresponding to an order of selection, one sample cut was taken and in fields growing jowar, bajra, maize, wheat (mixed) and barley (mixed) for each order of selection two sample cuts were taken.

2.7. *Driage experiments*: The harvesting of crops in the sample cut of radius 4' was done in two stages—first in a circle of radius 2'3" and then in the annular portion. The yield of crop from the circle of radius 2'3" from each sample cut was used for driage experiments to obtain the driage factor for obtaining the production of dry crop.

2.8. *Concepts and definitions*: Some of the important concepts and definitions used in the survey are described below.

2.8.1. *Sample Village*: A revenue village corresponding to the census village was taken as the sample village for land utilisation survey and crop-cutting experiments. Generally, the revenue village and census village were identical, but in some cases the two were not identical. When the selected census village was a part of a revenue village, the whole of the revenue village was surveyed. If, on the

Land Utilisation Survey and Crop-cutting Experiments

other hand, the census village was formed by more than one revenue village, one of the revenue villages was chosen at random with equal probability for the purpose of the survey.

2.8.2. *Season* : For each of the crops grown in a village, appropriate season was assigned on the basis of the period of harvesting of the crop in the village in a normal year. The months of harvesting in a normal year corresponding to the different seasons are given below.

| season of the crop | normal months of harvesting |
|-----------------------|--------------------------------|
| (1) | (2) |
| Autumn | August to October |
| Winter | November to January |
| Spring | February to April |
| Summer | May and June |

Note : July was taken to correspond to summer or autumn depending on the crop and region.

When harvesting of a crop in a normal year was spread over two seasons, the crop was assigned to that season which covered the greater part of the harvesting period.

2.8.3. '*Proper time*' of visit for land utilisation survey and crop-cutting experiments : The land utilisation survey was to be carried out in a village in proper time with respect to cereal and pulse crops for each of the three seasons autumn, winter and spring. The proper time for area survey for a season was the period when the sowing of all the crops of that season had been completed but harvesting had not yet started and the crops were unmistakably identifiable. Crop-cutting experiments were to be carried out when the crop was ripe and ready for harvesting in the selected fields.

2.8.4. *Plot* : For the purpose of the enquiry, a plot was defined as a distinct patch of land generally having a major survey number; in some states (Maharashtra, Madhya Pradesh, Gujarat and Rajasthan) where the boundaries of sub-survey numbers were shown in maps, they were taken as plots.

2.8.5. *Pure crop and mixed crops* : When only one crop was grown in a patch of land, it was considered as growing pure crop. A patch of land which was growing two or more crops in intermixture was taken to be under mixed crops. In the case of mixed crops, the components might be sown (or harvested) at the same time or at different times. Sometimes the components might be at different stages of growth (e.g. one of the components might be harvestable while others might be just sprouting up from the ground). When a crop was grown in an orchard, it was

National Sample Survey

considered to be under mixed crop. Also crops grown in alternate strips, each of width less than 8' were treated as mixed crops.

2.8.6. *Sub-plot* : In a plot, a distinct patch growing a crop or a particular mixed crop was treated as a sub-plot. A plot was considered to have as many sub-plots as there were different patches growing the crops singly or in mixture.

2.8.7. *Ail or bund* : A plot is demarcated generally by a strip of raised land commonly known as ails or bunds. Besides these, there may be ails inside the plots. Some of the inside ails will be more or less of a permanent nature having almost the same height as boundary ails. These inside ails were treated in the same manner as boundary ails.

2.8.8. *Gross area under a crop* : If a patch of land was under a mixed crop, then the total area under the mixed crop was taken to be the gross area under each of the components of the mixed crop. When a crop was grown pure in a patch of land, the gross area under the crop was the same as the area under the crop.

CHAPTER THREE

SUMMARY RESULTS

3.1. The estimates of production and gross area for each of the seven crops paddy, jowar, bajra, ragi, maize, wheat and barley at all-India level are given in this chapter.

3.2. It may be noted that the estimates do not cover summer crops. The villages of sub-sample 3 were an additional sample, surveyed by new staff after the commencement of the survey. Autumn season was not planned to be covered in these villages. For autumn season the combined estimates from sub-samples 1 and 2 have been substituted for sub-sample 3 to make the estimates for all seasons taken together from the three sub-samples comparable. Compared to sub-samples 1 and 2, there has been a heavier casualty in sub-sample 3 particularly in respect of crop-cutting. The estimates obtained from sub-sample 3 are subject to the limitations indicated above.

3.3. Estimates are given for each of the seven crops, paddy, jowar, bajra, ragi, maize, wheat and barley. For paddy, the figures of production and yield rate relate to clean rice. For converting dry paddy to clean rice, the factor 0.862 has been used.

3.4. Table (3.1) gives the estimates of production and gross area by sub-samples for each crop at all-India level.

TABLE (3.1): ESTIMATES OF PRODUCTION AND GROSS AREA UNDER MAJOR CEREAL CROPS BY SUB-SAMPLES: AUTUMN, WINTER AND SPRING 1961-62

all India

| 8. all crops | 273381 | 56.73 | 43.27 | 100.00 |

3.6. Comparison of NSS estimates of production and gross area for 1961-62 and 1960-61 : The NSS estimates of production and gross area for the years 1961-62 and 1960-61 are given in Table (3.3).

TABLE (3.3) : NSS ESTIMATES OF PRODUCTION, GROSS AREA AND GROSS YIELD RATE OF CROPS FOR 1960-61 AND 1961-62
all India

| crop | production (000 tons) | | gross area (000 acres) | | gross yield rate (lb./acre) | |
|-----------|-----------------------|---------|------------------------|---------|-----------------------------|---------|
| | 1960-61 | 1961-62 | 1960-61 | 1961-62 | 1960-61 | 1961-62 |
| (1) | (2) | (3) | (4) | (5) | (6) | (7) |
| 1. rice | 41608 | 42146 | 98525 | 103394 | 946 | 918 |
| 2. jowar | 15893 | 9264 | 60973 | 54082 | 566 | 581 |
| 3. bajra | 4470 | 3894 | 39330 | 32227 | 255 | 280 |
| 4. ragi | 2317 | 2284 | 7563 | 6661 | 705 | 702 |
| 5. maize | 6522 | 6034 | 15148 | 14940 | 964 | 998 |
| 6. wheat | 15623 | 15440 | 46038 | 48033 | 767 | 717 |
| 7. barley | 4530 | 3771 | 13332 | 14044 | 761 | 605 |
| 8. total | 90472 | 82833 | 260809 | 273381 | — | — |

For paddy, wheat and barley, though the total gross area in 1961-62 had been more than the corresponding figures in 1960-61, the total production in 1961-62 was less than that of the previous year. In 1961-62 there was a decline in acreage as well as production in respect of jowar, bajra, ragi and maize compared to the previous year. The gross yield of crops was generally less in 1961-62 for all the crops except bajra and ragi. For jowar particularly, the reduction in acreage and production was more marked.

Land Utilisation Survey and Crop-cutting Experiments

3.7. Comparison of NSS estimates and official figures of production for 1961-62 and 1960-61.

CHAPTER FOUR

STATISTICAL TABLES

4.1. The various statistical tables relating to the survey are given in this chapter.

4.2. The season-wise estimates of production and gross area at all-India level by sub-samples are given in Table (1). The unweighted gross yield rates of irrigated and non-irrigated crops at state level are given in Tables (2) to (8). In preparing Tables (2) to (8) only those crop-cutting experiments which were reporting irrigation particulars were taken into account and hence the number of crop-cutting experiments shown in those tables may not be equal to the total number of crop-cutting experiments conducted. The unweighted gross yield rates of each of the crops separately for pure crop and mixed crop at state level are given in Tables (9) to (15). Tables (9) to (15) are prepared on the basis of only those experiments included in Tables (2) to (8) and hence the number of experiments shown in Tables (9) to (15) will be differing from the total number of experiments conducted. The drainage factors (i.e. ratio of weights of dry crop to green crop) for each crop are given for each season in Tables (16) to (18). The number of sample villages planned and number surveyed for land utilisation survey and for crop-cutting experiments are given by states and seasons. The number of crop-cutting experiments conducted on each crop separately for pure crop and mixed crop by seasons at state level is also given.

LIST OF TABLES

| | PAGE |
|--|------|
| TABLE 1 : Estimates of production and gross area under major cereal crops by seasons and sub-samples, 1961-62 | 14 |
| 2 : Unweighted gross yield rate of rice for irrigated and not irrigated crop, by states and sub-samples | 15 |
| 3 : Unweighted gross yield rate of jowar for irrigated and not irrigated crop by states and sub-samples | 16 |
| 4 : Unweighted gross yield rate of bajra for irrigated and not irrigated crop by states and sub-samples | 17 |
| 5 : Unweighted gross yield rate of ragi for irrigated and not irrigated crop by states and sub-samples | 18 |
| 6 : Unweighted gross yield rate of maize for irrigated and not irrigated crop by states and sub-samples | 19 |
| 7 : Unweighted gross yield rate of wheat for irrigated and not irrigated crop by states and sub-samples | 20 |
| 8 : Unweighted gross yield rate of barley for irrigated and not irrigated crop by states and sub-samples | 21 |
| 9 : Unweighted gross yield rate of rice separately for pure crop and mixed crop by states and sub-samples | 22 |
| 10 : Unweighted gross yield rate of jowar separately for pure crop and mixed crop by states and sub-samples | 23 |
| 11 : Unweighted gross yield rate of bajra separately for pure crop and mixed crop by states and sub-samples | 24 |
| 12 : Unweighted gross yield rate of ragi separately for pure crop and mixed crop by states and sub-samples | 25 |
| 13 : Unweighted gross yield rate of maize separately for pure crop and mixed crop by states and sub-samples | 26 |
| 14 : Unweighted gross yield rate of wheat separately for pure crop and mixed crop by states and sub-samples | 27 |
| 15 : Unweighted gross yield rate of barley separately for pure crop and mixed crop by states and sub-samples | 28 |
| 16 : Ratio of dry weight to green weight of cereal crops of autumn season | 29 |
| 17 : Ratio of dry weight to green weight of cereal crops of winter season | 30 |
| 18 : Ratio of dry weight to green weight of cereal crops of spring season | 32 |
| 19 : Number of sample villages planned and number surveyed for land utilisation survey in each season by states | 34 |
| 20 : Number of sample villages planned and number surveyed for crop-cutting experiments for each season by states | 35 |
| 21.1 : Number of crop-cutting experiments conducted on paddy grown pure and in mixture with other crops by seasons and states : sub-sample 1 | 36 |
| 21.2 : Number of crop-cutting experiments conducted on paddy grown pure and in mixture with other crops by seasons and states : sub-sample 2 | 37 |

Villages of sub-sample 3 were not planned to be surveyed in autumn season.

APPENDIX I

ESTIMATION PROCEDURE

1. A stratified two-stage sampling design was adopted for the land utilisation survey with villages selected with equal probability as the first-stage units and clusters of plots selected systematically with equal probability as the second-stage units. In a village when a suitable frame of plots was not available, a sample of households was selected with equal probability from a list of all the households in the village and all the plots possessed by each of the sample households were surveyed. For crop-cutting experiments, the villages and clusters of plots selected for land utilisation were the first- and second-stage units and sub-plots growing the specified crops (selected with probability proportional to gross area) and circular area of radius 4' located at random in the selected sub-plot were the third- and fourth-stage units. The method of estimation of area and production of a crop for a season is given below.

2. *Estimate of area under a crop.*

2.1. Except in the case of a few strata in hilly and forest areas, an estimate of area under a crop (X_i) for the i -th stratum (gross or pure area as the case may be) was obtained as

$$X_i = A_i \frac{\sum_{j=1}^{n_i} a_{ij} p_{ij}}{\sum_{j=1}^{n_i} a_{ij}} \quad \text{where}$$

A_i = geographical area of the i -th stratum,

a_{ij} = geographical area of the j -th sample village surveyed in i -th stratum,

p_{ij} = proportion of area under the crop (gross or pure as the case may be) in the j -th sample village surveyed in the i -th stratum,

n_i = number of villages surveyed in the i -th stratum.

2.2. An estimate of proportion (p_{ij}) of area under the crop for the i -th sample village in the i -th stratum was given by

$$p_{ij} = \frac{\sum_{k=1}^{n_{ij}} a_{ijk} p_{ijk}}{\sum_{k=1}^{n_{ij}} a_{ijk}} \quad \text{where}$$

a_{ijk} = geographical area of the k -th sample plot in the j -th sample village in the i -th stratum,

Land Utilisation Survey and Crop-cutting Experiments

- p_{ijk} = proportion of area under the crop (gross, or pure as the case may be) in the k -th sample plot in the j -th sample village in the i -th stratum,
 n_j = number of plots surveyed in the j -th sample village in the i -th stratum.

2.3. In hilly and forest areas as the basic materials required for estimating the area under crops as per the above procedure were not satisfactory, an alternate estimation procedure was adopted as follows. An estimate of area under a crop (X_i) for the i -th stratum was obtained as

$$X_i = \frac{N_i}{n_i} \sum_{j=1}^{n_i} k_{ij} \frac{N_{ij}}{n_{ij}} \sum_{k=1}^{n_{ij}} x_{ijk} \text{ where}$$

- x_{ijk} = area under the crop in the k -th sample plot/or in all plots possessed by k -th sample household,
 n_j = number of plots/households surveyed in the j -th sample village in the stratum i ,
 k_{ij} = number of revenue villages comprising the census village or number of hamlet groups formed in the revenue village or reciprocal of the number of census villages constituting the revenue village,
= 1 when the revenue village and census village are identical,
 N_{ij} = highest survey number/sampling serial number/total number of households in the j -th sample village in stratum i ,
 N_i = number of villages in the stratum i ,
 n_i = number of villages surveyed in the stratum i .

2.4. The estimate of area under a crop was obtained from each of the sub-samples. The estimate based on all the sub-samples was obtained as the arithmetic mean of the sub-sample estimates.

3. *Estimate of production of a crop :*

3.1. An estimate of production of a specified cereal crop of a season for any stratum was obtained as the product of the estimated gross area under the crop and the estimated gross yield rate of the crop in the stratum. The estimates of gross yield rate and production were obtained separately for

- i) crop grown singly (pure)
- ii) crop grown mixed with other crops.

The total production of the crop was obtained as the sum of the production of the crop grown pure and of the crop grown in mixture.

National Sample Survey

3.2. An estimate of the yield rate of a crop for the i -th stratum (y_i) was taken as the simple average of the yield rates obtained from the sample cuts taken for the crop in the i -th stratum, viz.

$$y_i = \frac{\sum_{j,k} y_{ijk}}{r_i}$$

where y_{ijk} is the yield rate (gross) of the crop from the k -th sample cut in the j -th sample village in the i -th stratum, and Σ indicates summation over all cuts taken for the crop in all the sample villages in the stratum and ' r_i ' is the number of cuts taken for the crop in the stratum. This was obtained separately for crop grown pure and mixed.

3.3. The estimate of production $P_i(p)$ of the crop grown pure for the i -th stratum was given by

$$P_i(p) = A_i(p) \times y_i(p) \text{ where}$$

$A_i(p)$ = estimated area under crop grown pure for the i -th stratum,
 $y_i(p)$ = yield rate of crop grown pure for the i -th stratum.

Similarly the estimate of production $P_{i(m)}$ of the crop grown mixed for the i -th stratum was obtained as

$$P_{i(m)} = A_{i(m)} \times y_{i(m)} \text{ where}$$

$A_{i(m)}$ = estimated gross area under the crop grown mixed, for the i -th stratum,

$y_{i(m)}$ = gross yield rate of crop grown mixed.

3.4. If crop-cutting experiments were not reported in all strata where an estimate of area under a crop was obtained, the final estimate of production for the state (P) was obtained as

$$P = \frac{\sum' P_{i(p)}}{\sum' A_{i(p)}} \times \sum A_{i(p)} + \frac{\sum' P_{i(m)}}{\sum' A_{i(m)}} \times \sum A_{i(m)}$$

where Σ' indicates summation over all strata reporting crop-cutting experiments and Σ indicates summation over all strata in the state. The estimate of production P for the state was obtained separately for the two sub-samples.

3.5. Each crop-cutting experiment consisted of taking two concentric circular sample cuts, one of radius 2'3" and the other of radius 4'. The data from the circular cuts of radius 4' were used, for getting the estimates of yield rates, while the data from the smaller circle were used to obtain the dry weight factor (ratio of dry weight to green weight of crop). The adjustment for obtaining the dry weight from the green weight was done at the state level. If d_{ie} and g_{ie} are the dry weight and

Land Utilisation Survey and Crop-cutting Experiments

green weight respectively of the crop from c-th sample cut of radius 2'3" for the crop in the i-th stratum in a state, the conversion factor (driage factor) was obtained as

$$\frac{\sum_{i,c} d_{i,c}}{\sum_{i,c} g_{i,c}}$$

Σ indicating summation over all cuts taken for the crop in all strata in the state.

The driage factors were obtained separately for each season and sub-sample which were used to obtain the estimates of production of the crop corresponding dry crop.

4. The estimate of production of dry crop for all the sub-samples combined was obtained as the arithmetic mean of the corresponding sub-sample estimates.

5. The estimates of area and production of crops were obtained separately for each of the three seasons. The sum of the estimates for the three seasons was taken to be the estimate for the year (excluding summer crops).

7. *Estimate of any character at State or All-India level* : The state or all-India estimates of any character were obtained by summing the corresponding strata estimates over the State or all-India.
