ACKNOWLEDGEMENT

The report was finalised by Sudhir Bhattacharyya. Supervision at technical level was entrusted to A. Roy Chowdhury, S. Mukherjee, M. S. Murty at the NSS Operations—Baranagar, Giridih and Delhi respectively.

Supervision of computing, punching and machine tabulation was done by H. B. Chowdhury, Rajen Roy, B. B. Chakrabarty, S. Palit, B. L. Banerjee, S. N. Das, A. K. Chowdhury, P. Mukerjee and F. M. Raq.

The survey was planned by the Indian Statistical Institute (ISI). The field work was carried out by the Directorate of the National Sample Survey, Government of India, in all the States except West Bengal and Bombay city where Indian Statistical Institute collected the relevant data.

TABLES WITH NOTES ON EMPLOYMENT AND UNEMPLOYMENT IN RURAL AREAS

*This Report entitled Tables with Notes on Employment and Unemployment in rural areas ; 17th Round: September 1961—July 1962, was prepared by the I.S.I., Calcutta. The views contained in the report are not necessarily those of Govt. of India.**

CHAPTER ONE

INTRODUCTION

1.1 In the Seventeenth Round also Employment and Unemployment was a subject of enquiry in the NSS programme in rural areas. The collection of the data on employment and unemployment in urban areas was also part of NSS programme in the Seventeenth Round and as in the Sixteenth Round two separate schedules of enquiry were canvassed, one for the rural and the other for the urban areas. In this report the data on rural areas are presented.

1.2 The survey covered the whole of rural India as defined in the 1951 Census excluding Andaman and Nicobar Islands, Laccadive, Minicoy and Amindivi Islands, Ladakh district of Jammu and Kashmir, the disturbed areas of Manipur and the North East Frontier Agency. Altogether a sample of 4310 villages, including 422 price villages of Sixteenth Round constituted the Central sample of the enquiry.

1.3 The States of Andhra Pradesh, Bihar, Gujarat, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab and Uttar Pradesh participated in this round in the programme of work of the NSS on a full matching basis. The State of Rajasthan participated on a half matching basis. The report is based on the data collected in the Central sample only.

1.4 The State-wise distribution of sample villages belonging to the Central sample was as follows :

state	number of villages
(1)	(2)
1. Andhra Pradesh	288
2. Assam, Manipur, Tripura	236
3. Bihar	336
4. Gujarat	136
5. Kerala	134
6. Madhya Pradesh	321
7. Madras	238
8. Maharashtra	274
9. Mysore	170
10. Orissa	120
11. Punjab, Delhi, Himachal Pradesh	150
12. Rajasthan	153
13. Uttar Pradesh	342
14. Jammu and Kashmir	334
15. West Bengal	218
16. All India	3,450

1.5 The important concepts and definitions adopted in the survey are given in Chapter Two and the statistical tables in Chapter Four. A note on sample design and procedure of estimation is contained in Appendix I. Appendix II is the facsimile of the schedule of investigation.

*The draft report (No. D 197) was first submitted by the Indian Statistical Institute, Calcutta, to the Government of India in March 1969. It was revised subsequently and resubmitted in May 1970.

CHAPTER TWO

CONCEPTS AND DEFINITIONS

2.1 The important concepts and definitions adopted in this survey and mainly those used for the classification of population have been explained in this section.

2.2 *Household* : The normal resident member concept of household was adopted in this survey. Persons who normally passed nights under the same roof and normally took food from the same kitchen were considered as members of household. Guests were thus excluded and temporary stay-away were included.

2.3 *Activity* : The classification of persons into gainfully employed, unemployed and not in labour force was done on the basis of information on their activity during the reference week. While determining the nature of activity a person may be found to be either working or not working, but seeking and/or available for work or not available for work. The first of the above activity categories can be equated to the already familiar category 'gainfully employed'. The second to the category 'unemployed' and third to 'not in labour force'.

2.4 *Working* : A person was directly or indirectly occupied in some work or in a job in an establishment on at least one day during the reference week, was treated as 'working'. The participation in work need not always result in the production of goods and services. As for example, a doctor sitting in a market place without any customer and a locksmith out on his professional rounds without any demand for his services at the moment, though not actually engaged in the production of goods and services, will still be considered as 'working'.

2.5 A person might be having some work to do but did not actually perform the work during the reference week. In such cases the reason why he did not work will be ascertained. If he did not work because of reasons such as illness, injury, vacation, holiday, festival, inclement weather, etc., he was treated as 'working'.

2.6 Detailed status of activity of persons reporting 'working' during the reference week was also collected to determine as to whether they were self-employed (*i.e.*, employer or own account worker), wage or salary earners (*i.e.*, employee) or dependent members of household working in family enterprise (*i.e.*, unpaid family enterprise worker).

2.7 The following six sub-categories were used to classify 'working' persons into the detailed status of activity :

- (a) working in household enterprise :
 - (1) as owner-operator hiring labour in current week
 - (2) as owner-operator not hiring labour in current week
 - (3) as working partner hiring labour in current week
 - (4) as working partner not hiring labour in current week
 - (5) as dependent member of household
- (b) working for salary or wages.

The above categories a(1) and a(3); a(2) and a(4); a(5) and (b) will respectively constitute the activity status categories—employer, own account worker, unpaid family enterprise worker and employee adopted in urban labour force survey.

2.8 *Seeking and/or available for work* : The term is self-explanatory and stands for persons reporting not working during the reference week and either seeking or available for work. The nature of job seeking and availability of work were determined by putting the following probing questions to persons who reported as seeking and/or available for work :

- (a) whether seeking work for the first time
- (b) whether seeking work not for the first time
- (c) whether not seeking but available for full time work
- (d) whether not seeking but available for part time work

Persons reported 'seeking or available for work' constitute the familiarly known category—the 'unemployed'.

2.9 *Not available for work* : Persons reporting not working and neither seeking nor available for work during the reference week were considered as persons 'not available for work' and they were the persons who were classified as persons 'not in labour force' in earlier N.S.S. rounds and also in Urban Labour Force Survey. Reasons of non-availability was ascertained under the following seven categories : (1) too young, (2) too old, (3) infirm-disabled, (4) engaged in studies, (5) living on past savings, rent or interest, (6) domestic work, (7) others.

Persons classified as 'working' and 'seeking or available for work' together constitute 'labour force'.

2.10 *Priority Scale* : To obviate the difficulty of classifying a person under unique activity status when the person was engaged in more than one activity during the reference week a system of priority scale was adopted as in the previous N.S.S. rounds. The status of 'working' got priority over the status of 'not working' and the status of 'seeking work' and/or 'available for work' got priority over the status of 'not available for work'.

2.11 *Industry* : The nature of establishment, undertaking or service in which the gainful work was done was denoted by 'industry'.

2.12 *Occupation* : The nature of work which the person had to perform was denoted by 'occupation'.

CHAPTER THREE

SUMMARY OF FINDINGS

3.1 Some important findings of the survey is presented in this chapter. An outline of the broad demographic features of the rural population is given here as background material before their activity characteristics (employment, unemployment and under-employment) are discussed.

3.2 *Age* : The NSS seventeenth round survey was conducted during September 1961—July 1962, and the census operation took place just the preceding year. Comparison of the distribution of rural population by age groups as obtained from the NSS with that of 1961 census may be of interest to critical readers. The NSS and the census results (the distribution of rural population by age group and sex) are given in the table (3.1).

3.3 *General education* : The distribution of the rural population by the general education is given in Table (3.2). To facilitate comparison of results between two rounds of NSS, similar estimates for the NSS sixteenth round are also presented below :

3.5 It may be observed that 37.50 per cent of the rural population are in labour force, 52.20 per cent among males and 22.16 per cent among females. The two components of labour force : working population and persons available for work are 35.58 per cent and 1.92 per cent respectively. Compared to 16th round estimates, the 17th round estimates have gone down substantially. The reduction is 4.38 per cent of the total rural population. This scaling down of the proportion of labour force is observed both among males and females. The plausible reason might be that the fringe population in labour force *i.e.*, the house worker and the people of younger ages (age group 10—14) who, under the conditions prevailing in rural areas often combines house-work with gainful work or work only incidentally in some months of the year, were misclassified either as house-worker or too young instead of as 'working'. The chance of this type of misclassification is not remote because the distinction that can be drawn between the unpaid household enterprise worker and a house-worker is very thin and the two work are often very much intertwined. Another probable reason that might be ascribed for this scaling down of the proportion of labour force in the seventeenth round was that a section of these young people in the age group 10-14 who could have been classified as 'available for work' (*i. e.* as unemployed) had actually been classified as too young and for this the field instruction (for the urban labour force survey)—that person below 14 need not be considered as unemployed person—might have conditioned the understanding of the NSS field investigators in rural areas and in consequence a section of the children below 14, not working and available for work during the reference period were classified as too young when they should otherwise have been classified as persons available for work. This is a pure conjecture but some statistical evidence in favour of such conjecture may be found in the seventeenth round estimates of 'too young' in the age bracket 10—14. In the seventeenth round this is 14.60 per cent compared to 8.27 per cent in the sixteenth round. Another factor which might have contributed in scaling down the proportion of labour force in this round was that the survey period was only 11 months and did not cover the month of August which synchronised with khariff season in some of the States of India. It is interesting to note that almost similar distribution (population by activity) is observed for different months of the year (*i.e.* in the different sub-rounds of the survey) when sub-roundwise estimates (Table 3.4) are compared with the combined estimate for the 17th round (Table 3.3), of course, some deviation from the average is found in the estimates of subround 1 and sub-round 3. In these two sub-rounds the percentage in labour force is slightly above (40.45 per cent and 38.18 per cent) the average (37.50 per cent). The estimate of the percentage in labour force for sub-round 1 (40.45 per cent), again is almost the same as it is for the 16th round. Thus from this analysis of sub-roundwise data it is difficult to infer whether the difference between the 16th and 17th rounds estimates is solely due to misclassification of the fringe population (*i.e.* houseworker and children below age 14), since this difference has been observed only in one round of the survey. A further probing enquiry into the data of subsequent rounds may perhaps be necessary to know more clearly the effect of misclassification of fringe population in surveys on employment and unemployment in rural areas.

3.6 *Labour force participation* : The crude participation rates thrown up by the 17th round survey results is 37.50 per cent of the rural population; 52.20 per cent among males and 22.16 per cent among females. But age specific participation rate i.e. the rate of labour force participation among the population in each of the age-groups will be technically more meaningful. The labour force participation rate in each of the age groups by sex is presented in Table (3.5).

3.7 *Industrial classification of working population* : In Table (3.6) is given the distribution of working population by industry. Agriculture, which includes livestock, forestry, fishing etc. provides employment about 80 per cent of the working population in rural areas. Next in order of importance are those in manufacturing (7.95 per cent). Among the rest, the proportion in services (4.94 per cent) and trade and commerce (2.76 per cent) are worth mentioning.

3·10 *Intensity of work* : The data on intensity of work of working persons in rural areas in terms of "weekly days of work" and weekly hours at work" will be useful for making any study on underemployment in rural areas. In the Table (3·8) is given the distribution of working persons by days at work.

3·11 It is observed that 72·28 per cent of the working population work for all the seven days in a week. Persons working for 4 days in a week or less however, are not few. They constitute about 11·71 per cent of the total working population; 11·10 per cent among males and 13·28 per cent among females.

3.12 The intensity of work in different branches of economic activity in rural areas in terms of 'average days at work' in a week is presented in Table (3.9). To critically examine the above aggregates of intensity of work the following data may be useful.

3.13 Intensity of work in terms of 'hours at work' is considered a better measure since the work content on a day may not be the same for all persons. It will be seen from the Table (3.9) that 15.94 per cent of the working population, 11.94 per cent among the males and 26.28 per cent among the females work for 4 hours or less in a day. The proportion of working population working for more than 4 hours but not above 6 hours is 19.79 per cent 16.71 per cent among males and 27.86 per cent among females.

3.14 *Under-employment* : It has been stated above that a sizeable proportion of working population in the rural areas work part-time. But all of them can not be straightaway termed underemployed—since all of them are not available for work. In this report only those who worked for less than normal hours (arbitrarily fixed for analysis) and at the same time were available for extra hours were treated as underemployed. Those who worked for 28 hours or less per week or on an average 4 hours or less per day and reported available for additional work were treated as severely underemployed. Similarly, those who worked for 29–42 hours per week and reported available for additional work might be treated as moderately underemployed. Following the above criterion, 4.05 per cent of the total working population in the rural areas; 3.96 per cent among males and 5.88 per cent among females were severely underemployed. The proportion of moderately underemployed among rural working population has been found to be 3.69 per cent; 3.74 per cent among males and 3.59 per cent among females.

3.15 *Incidence of unemployment* : It had been noted earlier that 1.92 per cent of the rural population—1.95 per cent among males and 1.89 per cent among females were not having any gainful work and were available for work i.e., unemployed persons among the total persons in the labour force will definitely be a better indicator to measure the real impact of unemployment in the rural areas. This measure is termed in this report as incidence of unemployment. The rate of incidence i.e., the proportion of unemployed as percentage of labour force is given in Table (3.11).

3·16 It is observed that the rate of incidence of unemployment is 5·12 per cent of the labour force in the rural areas, the rate of incidence being much higher (8·53 per cent) among females in the labour force compared to the rate (3·74 per cent) among the males. It is significant to note that considering both males and females together in the labour force the impact of unemployment is more pronounced in the age groups 15—19 and 20—24.

APPENDIX III
STATEMENTS OF THE BOARD OF INVESTIGATION

SAMPLE DESIGN AND PROCEDURE OF ESTIMATION

01.1 The sample design is a stratified two stage one for this survey in rural sector, the villages being the first-stage units and the households the second stage units.

01.2 *Units Stratification* : In each State, 'regions' were formed by grouping contiguous districts having similar crops pattern and population densities. 48 such regions were formed in the whole of India. Within a region contiguous tehsils fairly homogeneous with respect to population densities were grouped together to form compact strata such that the rural populations of the strata were approximately equal. The number of strata formed in a region was one-eighteenth the allocation (number of villages) to that region. In the whole of India 216 strata were formed. Excepting for Manipur and Tripura, the same strata formed in the sixteenth round were retained as such in this round also. While Manipur constituted a stratum by itself, Tripura had been divided into 5 strata by grouping contiguous sub-divisions.

01.3 *Allocation* : Excluding Manipur and Tripura, the sample size (number of villages) for the different States remained the same as in the sixteenth round. For Manipur and Tripura the sample sizes were 18 and 90 respectively. The allocation of total sample size to the various States (except Jammu & Kashmir) was done on a joint consideration of rural population, area under food crops and the investigation strength in the NSS Blocks of the States. The allocations were rounded off to multiples of 18. Within a State, its allocation was further distributed among different regions in proportion to their rural population and the final allocations were rounded off to multiples of 18 to allow the selection of 3 independent sub-samples of 6 villages from each stratum formed in the region.

01.4 *Investigation Zone* : If a stratum had a very large area the following procedure was adopted to reduce the area covered by the investigator. The stratum was divided into two or more investigation zones (groups of contiguous tehsils) of roughly equal areas. Three investigation zones were selected with probability proportional to the number of villages in the zone with replacement a set of 6 villages was drawn from each of the selected investigation zones and these constituted one sub-sample. The two investigation zones selected for sixteenth round were kept as such for sub-samples 1 and 2.

01.5 *Selection of Villages* : In all the States except Tripura, within each stratum (or investigation zones) the tehsils were arranged in a serpentine order and 12 villages were selected circularly systematically with the interval I (integer nearest to $\frac{N}{12}$, N = total number of villages in the stratum or investigation zone) and with random start R_1 , from 1 to N . While the six villages with sampling serial number $R_1, R_1 + 2I, \dots, R_1 + 10I$ (taking $R_1 + KI - N$ if $R_1 + KI > N$ for some K 's) constituted the sub-sample 1 of the Central sample with two other independent random starts R_2 and R_3 , two more sets of 12 villages each were selected as before; these formed the sub-samples 2 and 3 of the Central sample. In the strata of those non-participating States, the interval I used was the integer nearest to $\frac{N}{6}$ and three sets of 6 villages with three independent random starts were selected to constitute the sub-samples 1, 2 and 3 of the Central sample.

01.6 *Hamlet groups* : To reduce the workload for socio-economic survey in a large sample village, the investigator was allowed to divide the village into a specified number of hamlet groups of roughly equal population and to select one of them at random with equal probability. The socio-economic enquiries were confined to selected hamlet group.

01.7 *Sub-round* : The whole period of survey, 11 months, was divided into 6 sub-rounds of 8 weeks each or the socio-economic enquiries.

01.8 *Selection of households* : The total sample size of 96 households for the set of 6 villages in a sub-sample and stratum was allocated to the different villages proportional to their 1951 population. After arranging the households in the village in their second stage strata, equal number of households were drawn circularly systematically from each second stage stratum using independent random starts. Households with at least one member self-employed in professions and services constitute stratum 1. Among other households those with at least one self-employed person in any non-agricultural enterprise and those with no self-employed person constitute stratum 2. The remaining households *viz.*, those with all members self-employed in agriculture constitute stratum 3.

01.9 Estimation Procedure: \hat{T} , the estimate of the total of any characteristic from a particular sub-sample is given by

$$\hat{T} = \sum_{s=1}^K \frac{N_s}{n_s} \sum_{i=1}^{n_s} f_{si} D_{si} \sum_{r=1}^3 \frac{H_{si}^{(r)}}{h_{si}^{(r)}} \sum_{j=1}^{h_{si}^{(r)}} X_{sij}^{(r)}$$

- where
- s = subscript for sth stratum
 - i = subscript for ith sample village/selected part of village
 - j = subscript for jth sample household
 - K = subscript for the number of strata in the state
 - N = total number of villages
 - n = subscript for the number of sample villages
 - D = subscript for the number of hamlet groups formed in a village (D = 1 if no such division was made)
 - H = subscript for the total number of households in the frame
 - h = subscript for the number of households
 - X = subscript for the value of the characteristic
 - (r) = subscript for the rth second stage stratum.

01.10 The above procedure produces true independent estimates from three sub-samples. The simple average of these estimates is the pooled estimate. In this report estimates have been presented in percentages. The percentages have been calculated after obtaining the numerator and denominator by the application of the above formula.

APPENDIX II

INDEPENDENT SUB-SAMPLE ESTIMATES

02.1 Independent sub-sample-wise estimates for a few selected employment characteristics of the rural population, considered to be representative, are given in this appendix with a view to providing some idea about the margin or error associated with the estimates.

02.2 In this survey the total number of samples allotted for each stratum was divided into three independent and interpenetrating sub-samples which were surveyed by three different investigators. Results presented here show side by side the sub-sample-wise estimates and the combined estimates.

02.3 If there are a number of sub-samples (say n) the probability that the true value of the characteristics lies between the largest and smallest of these sub-samples estimates is $(1 - \frac{1}{2^{n-1}})$, so that the absolute value of the difference between the two sub-samples immediately provide a 50 per cent confidence interval.
