THE NATIONAL SAMPLE SURVEY
TWENTY-FIRST ROUND (JULY, 1966—JUNE, 1967)
NUMBER 230

TABLES WITH NOTES ON CONSUMER EXPENDITURE

1. INTRODUCTION

1.1 This report contains the tables on the pattern of consumer expenditure of the population for the year July, 1966—June, 1967 in rural and urban areas of each of the states and union territories and the four big cities of the country. The primary data were collected by interviewing members of the sample households through the Integrated Household Survey (Schedule 16), conducted in the 21st Round of the National Sample Survey (NSS) during the year July, 1966—June, 1967. This schedule has been canvassed since the 19th Round (July, 1964—June, 1965) of NSS with a view to obtaining an integrated picture of the household economy. The information collected from a sample household through this schedule of enquiry included data on (a) operation of household business (the production account), (b) disbursement of the household earnings for various living purposes (the consumption account), and (c) the investment behaviour of household (the investment account). In addition to these, other related information on demography and employment were also collected in this schedule.

1.2 *Geographical coverage.*—The survey covered both the rural and the urban areas of the Indian Union excepting the following regions : Andaman and Nicobar Islands, Laccadive, Minicoy and Amindivi Islands, Ladakh district of Jammu & Kashmir, NEFA, Nagaland, Mao Ukhrul and Tamenglong sub-division of Manipur, Mizo (Lushri) Hills district of Assam, Pal and Samarai Tehsils of district Surguja and Bijapur, Dantewara and Korta Tehsils and district Bastar in Madhya Pradesh.

1.3 *Sample size.*—The total number of sample villages for the rural survey was 8520 and in urban areas, 4740 blocks were surveyed. Result presented in this report are based on the data collected from the central samples.

2. CONCEPTS AND DEFINITIONS

2.1 Some important concepts and definitions used for the enquiry are described in this section.

2.2 *Household*.—A household is a group of persons normally living together and taking food from the same kitchen. A boarding house, a hotel or a hostel is treated as a cluster of households, where each individual boarder (with his dependents or guests) was considered as a separate household. Institutional population like inmates of jails, police quarters, cantonments, hospitals, asylums, relief camps are excluded from the scope of the enquiry.

2.3 *Household member*.—Any person who took principal meal with the household for at least 16 days during a period of 30 days preceding the date of enquiry is considered to be a member of the household. Such a person may be the head of the household or a relation or a protege of the head or an employee or a guest of the household.

2.4 *Household size*.—The total number of numbers composing a household is the size of the household.

2.5 *Consumption*.—The consumption data is strictly restricted to the non-productive consumption of the household including that of the pet animals (domestic animals which are not used for the household enterprise e. g., dog, cat, hare, parrot, peacock etc.) if any. But consumption by livestock of the household is for productive enterprise and as such are not included in the household consumption. However the livestock products like milk, meat, egg, etc consumed by the household is considered as household consumption and is also accounted for accordingly. While transfer payment in kind is not to be treated as consumption, consumption out of transfer receipt in kind like borrowing, gifts charities perquisites received by the household, free collection and other receipts in kind, if any, have to be considered.

2.6 *Consumer Expenditure*.—The value of consumption out of transfer receipts and the value of receipt in exchange of goods and services is imputed at the average retail price prevailing in the locality during the reference period. Whereas the value of consumption out of homegrown stock is imputed by ex-farm (or ex-factory) price which is free from distribution cost or middleman's profit and other trade margins.

2.7 Tables in this report are presented for 20 broad groups of items—13 for food items and 7 for non-food items.

2.8 The results presented in the report are preliminary in the sense that data for the broad group of items are taken from the summary block of the schedule.

Consumer Expenditure (Preliminary)

APPENDIX II

SAMPLE DESIGN AND ESTIMATION PROCEDURE

II. 1 The general sample design was stratified with two-stage selection within each stratum; the first stage units being villages/blocks in the rural/ urban area and the second stage units the households. The first stage units were selected circularly systematically with probability proportionate to size, the measure of size being related to the population and the households were selected linearly systematically.

II. 2 The sample design had been made self-weighting at state level in rural area and at stratum level in urban area.

II. 3 **Sample size** : The total number of sample villages and urban blocks in which the integrated household schedule was canvassed were 8520 and 4740 respectively. A statement showing statewise sample size for central and state samples is given in table (1).

Rural Sampling Scheme

II. 4 **Sampling frame** : The frame used for selection was the list of villages as per 1961 population census. Though the unit of selection was the census village the unit of survey was taken as the revenue village(s) corresponding to the sampled census village.

II. 5 **Stratification** : The whole country was divided into 63 regions. Strata were formed within each region by grouping contiguous tensils having similar population densities and altitudes and having good transport and communication facilities amongst them as far as possible, such that the sum of the size measures of the villages for each stratum within a State/Union Territory is the same. The size of a village is the ratio of its population to the average population of a village in the population class 0—499 of that state, rounded off to a suitable integer. The number of strata to be formed in a state was obtained as the ratio of its allocation to 24 and the total size measure of a stratum was given by the ratio of the total size for the state to the number of strata.

TABLE (1) : STATEWISE NUMBER OF SAMPLE VILLAGES AND BLOCKS IN THE CENTRAL SAMPLE

Srl. No	state/union territory	number of sample	
		villages	blocks
(1)	(2)	(3)	(4)
1.	Andhra Pradesh	672	384
2.	Assam	360	144
3.	Bihar	768	312
4.	Gujarat	360	192
5.	Haryana	128	56
6.	Jammu & Kashmir	360	288
7.	Kerala	360	144
8.	Madhya Pradesh	720	288
9.	Maharashtra	696	600
10.	Mysore	408	216
11.	Orissa	360	144
12.	Punjab	232	104
13.	Rajasthan	384	216
14.	Tamil Nadu	624	360
15.	Uttar Pradesh	1,056	576
16.	West Bengal	552	432
17.	Delhi & Chandigarh	24	126
18.	Goa, Daman, Diu	24	12
19.	Himachal Pradesh	24	14
20.	Manipur	192	48
21.	Pondicherry	24	12
22.	Tripura	192	72
23.	Total	8,520	4,740

II. 6 Allocation : The allocation of the total sample size of 8520 villages to the states was based on a joint consideration of the rural population, area under cereal crops and investigators available. This allocation was modified to ensure a minimum sample size of 360 villages in each state and about 200 sample villages in the Union Territories of Manipur and Tripura and to make them multiples of 24. The allocation to the regions within each state was proportional to their total size (related to population) and since the strata were formed so as to equalise their size content the allocation to the strata within a state were equal.

II. 7. Selection of Villages : The tehsils within each stratum were arranged in a serpentine order by considering geographical contiguity and 4 independent sub-samples of 12 villages each were selected circular systematically with probability proportional to size, size being related to population as mentioned earlier. In each sub-sample the villages with odd orders of selection form the central sample and those with even order of selection form the state sample.

II. 8 Selection of Households : The households in a sample village/hamlet group were arranged on the basis of household size and means of livelihood class and then a linear systematic sample of households (22 on the average) was drawn to form the combined sample. From this combined sample, a sub-sample of 2 households on the average was selected linear systematically with interval 11 for the integrated household schedule.

Urban Sampling Scheme

II. 9 Sampling frames : The sample design was stratified two stage with urban block as the first stage units and households as the second-stage units. For block selection, the UFS frame had been used for all cities and towns whose population in 1961 was 50,000 or more (sector 1) and for about half the number of the remaining towns having population in 1961 less than 50,000 (sector 2); and the 1961 census frame had been used in the rest of sector 2 towns.

II. 10 Stratification : In each State/Union Territory, cities and towns with population 50,000 or more in 1961 formed one stratum (sector 1) and rest of the towns of the 1961 census formed the other stratum (sector 2). In Maharashtra 3 strata were formed : Bombay city (sector 0), the rest of sector 1 and sector 2.

II. 11 Allocation : The total sample size of 4740 blocks had been allocated to the States/Union Territories in proportion to their 1961 census urban population with twice the weight to sector 1.

II. 12 Selection of blocks : In sector 1 of each state, the blocks had been selected circular systematically with probability proportional to the size (pps), the size of each block being taken as its estimated population (as supplied in the UFS frame) rounded off to the next multiple of 1000. In sector 2, the towns had been classified by their means of livelihood pattern as per 1961 census into three classes— (1) agriculture, (2) industry, trade transport etc. and (3) others on the basis of proportions of persons in these classes.

II. 13 Selection of Households : From each sample block a combined sample of 23 households on an average were selected linear systematically after arranging the households on the basis of the number of unemployed persons, number of self-employed persons and the total households size. From this combined sample, households for the Integrated households Schedule were selected linear systematically with interval 8.

II. 14 Estimation Procedure

- s : subscript for sth stratum/sector
- i : subscript for ith sample village/block
- j : subscript for jth sample household
- k : number of strata/sector in the state
- n_s : Number of sample blocks selected (in urban areas) in a sector and in a sub-sample for the whole round
- h : number of households selected for the enquiry
- y : value of the characteristic
- \hat{Y} : estimate of the state total for the characteristic from a sub-sample for the whole round.

For rural areas

$$\hat{Y} = M \sum_{s=1}^k \sum_{i=1}^6 \sum_{j=1}^{h_{si}} y_{sij}$$

where M is the constant multiplier.

For urban areas

$$\hat{Y} = \sum_s M_s \sum_{i=1}^{n_s} \sum_{j=1}^{h_{si}} y_{sij}$$

where M is the constant multiplier for the 5th sector.
