THE NATIONAL SAMPLE SURVEY  
TABLES WITH NOTES  
ON  
SOME FEATURES OF HOUSEHOLD NON-REGISTERED TRADE

CHAPTER ONE

INTRODUCTION

1.0 Objective : In the twenty-fourth round of the National Sample Survey (NSS), main emphasis was laid on the enquiry on household trade. The survey was intended to throw up estimates of earnings of the household trading sector, not registered under the Sales Tax Act, at the national and state levels. The survey had the coverage both in the rural and urban areas and the sample size was fairly large.

1.1 Results presented in the report : A report <sup>1/</sup> covering some of the important characteristics of the survey has already been prepared which is now under printing. The present report besides giving some two-way distributions of trade households provides the estimates of employment in household trade, physical fixed assets used in the household trading sector, average gross earning in household trade derived by using the trade margin figures of different commodities as reported by the respondents and other related features of trading activity both for the rural and urban sectors at the all-India level (Appendix II). However the findings of the survey in respect of the use of physical assets in the household trading enterprise, their addition and depletion over a period of one year, proportion of such assets owned and taken on hire by the trade households and the gross earning of the trade households classified by commodity groups have been given for each state separately for the rural and urban sectors (Appendix III).

1.2 Geographical coverage : The survey was extended over the whole of the rural and urban sectors of Indian Union except North-East Frontier Agency, Ladak district of Jammu & Kashmir, Mizo Hills (Lushai) district in Assam, Pal and Samari tehsils of districts Surguja and Bijapur, Dentewara and Kanta tehsils of district Bastar of Madhya Pradesh, rural areas in Nagaland, Mao, Ukhrel and Tamenglong sub-divisions of the Union Territory of Manipur; Longai & Kanchanpur in Dharmanagar sub-division of the Union-Territory of Tripura, the Union Territories of Adaman & Nicobar Islands and Laccadive, Minicoy & Amindivi Islands.

---

<sup>1/</sup> : The NSS Draft report No. 249 (Tables with notes on household non-registered trade) was submitted to the Government in April 1974 and is under printing now.

1.3 Sample size : It was planned to survey altogether 8400 villages and 4632 blocks in four independent and interpenetrating samples, each of which could provide valid estimates of any characteristic. The results presented in the Appendices of this report are, however, based on the total sample. In the rural sector, in general all the trade households listed in the sample village were surveyed while in the urban sector, households were selected from the sample blocks following a self-weighting <sup>2/</sup> design at the state level ensuring a good proportion of the trade households to come in the sample.

1.4 Coverage of the trading sector in the survey : The survey covered only the trading enterprises operated by the household sector. The non-household trading activities like those undertaken by joint stock companies, co-operative societies and other similar bodies were excluded from the scope of the survey. In the household sector, households having trading enterprises registered under the Sales Tax Act were excluded. However, trading enterprises dealing in commodities exempted from the Sales Tax Act were considered for the survey even if the annual turnover exceeded the financial limit for the registration under the Sales Tax Act. In so far as the type of trading activities were concerned, the present survey covered both the wholesale and retail trade as well as activities like auctioneering, commission agency, brokerage, hiring out of durable goods. But brokerage or agency activities in stock exchange, insurance, real estate, state lotteries etc., and hiring out of conveyances did not come under the purview of this enquiry. Money lending activities were also excluded.

1.5 Definition of trade : Trading was defined as an act of purchase of goods and their disposal by way of sale normally involving no transformation of the goods during such transaction. However, when goods were purchased and some nominal processing work was done before selling without making any transformation of the goods purchased then such activities were considered under trading. Common examples of these types are the households of the hawkers who sell fruits after peeling off the skins and cutting the fruits into pieces, those households who sell soaked grams and green peas ~~mixed with onions,~~ pepper and salt, etc. Households having distributive trading activities in respect of the products manufactured by them were also taken into account under trading if such households kept separate accounts of the manufacturing and trading activities. In case of inclusion of such households under trading, account relating to the trading part only was considered for the survey.

---

<sup>2/</sup> : The details of the sampling design and the estimation procedure are given in Appendix I.

1.6 Frame for the trade households : A household was considered to be a trade household if at least one of its member was self-employed in trade (as per the coverage and definition of trade given in paragraphs 1.4 and 1.5) for at least one day during the reference period. Self-employed in trade were those who were either employers or own-account workers in trade having trade as principal or subsidiary occupation. Obviously households having only employees engaged in trade, were not taken into account. The households which reported trading activity (as defined earlier) during any day out of the 30 days preceding the date of listing formed sub-stratum 1 and those which reported the activity during any day out of the 365 days, other than last 30 days, preceding the date of listing constituted sub-stratum 2 of the frame. This report is based on the households belonging to sub-stratum 1 only.

1.7 Treatment of joint and multiple enterprises : For trading enterprises managed by two or more households ~~particulars~~ of different items of trading activity were collected for the entire joint enterprise and not for the sample household only. In such cases the percentage share in the profit of the sample household was used to derive the households' share for estimating different items of enquiry. In cases where households had more than one trading establishments, for the purpose of recording the data, such households were considered to have only one trading enterprise provided the households had sole proprietary right over all the establishments. But whenever two or more joint trading establishments or one proprietary (sole) and one or more joint establishments were managed by a household, schedules were filled in separately for each establishment of the household.

1.8 Survey period : The survey started in July 1969 and continued upto June 1970. The survey period of one year was split up into six sub-rounds of two months each.

1.9 Participation of States : Along with the work of the Central sample of the NSS, all the State Governments except West Bengal and Nagaland participated in the work of the NSS on a full-matching basis. The Union Territories of Manipur and Tripura also participated in the NSS work on a full-matching basis.

1.10 Field work and planning of the survey : The field work was entrusted to the Directorate of the National Sample Survey, Government of India in all the States and Union Territories except in West Bengal and Bombay City where the survey work was carried out by the Indian Statistical Institute. The Indian Statistical Institute was responsible for the planning and designing of the survey.

1.11 Facsimile of Schedules of enquiry etc. : The list showing the details of the commodity groups and the facsimile of the schedules of enquiry are given in Appendices IV and V respectively.

Some features of household non-registered trade

CHAPTER TWO  
SUMMARY OF FINDINGS

2.0 Some important findings of the survey in respect of various characteristics of the trade households for the rural and urban sectors of India are presented in this chapter. The discussion is restricted only to the findings of the survey at the all-India level which will give an overall picture of the activities undertaken by the household trading sector. The results discussed here are based on the total sample.

2.1 Trade as a perennial activity : The survey reveals that there were 26.47 lakh trade households in the rural sector and 14.03 lakhs in the urban sector of India. Households engaged in trade were found to pursue the activity throughout the whole year as 93 percent in the rural areas and little over 96 percent in the urban areas had trading as perennial activity.

2.2 Fixed capital assets in use in trade : In the rural areas 97 percent of the trade households were reported to use at least one of the fixed assets like land, building, tools & appliances, furniture & fittings, transport and other equipments. The same index for the urban areas was 90. Thus the percentage of households not using a single physical asset. in their trading activity in the urban areas was higher than that of the rural areas. This might be due to the fact that in urban areas considerable number of hawker households engaged in trade did not require any fixed asset for pursuing their activity. The value of fixed assets used in trade per trade household was estimated at Rs.697 for the rural sector and Rs.1646 for the urban sector. Both in the rural and urban sectors about 85 percent of the total value of physical assets in use in trade was accounted for by land and buildings.

2.3 Employment in household trade : The average number of persons including both the household members and hired workers engaged in trade per week in the trading households was 1.39 for the rural sector and 1.43 for the urban sector. In so far as the average number of mandays worked in trade per week is concerned, rural sector reported 8 mandays while urban sector engaged a little less than 11 mandays. The proportion of mandays put in by hired workers to the total mandays was negligibly small in rural sector (2.4 percent) while the same index

for the urban sector was 7.1 percent.

2.4 Gross earning in trade by using trade margin figures : The information on the gross trade margin of different commodities dealt in by the trade households were collected from the respondents by direct interrogation without going into the details of the accounts relating to the actual value of sales and purchase of merchandise of the trading enterprise. Gross trade margin for a commodity was defined as the value of gross earning expressed as a percentage of the purchase value of the commodity. Generally when a trader purchases some commodity he immediately fixes up its selling price as per the prevailing market rate. The difference of the selling price so fixed by the trader to the purchase price gave the gross earning from the particular commodity and gross trade margin was ascertained accordingly. Using the trade margin figures of individual commodities, the weighted trade margins for the important ten commodity groups classified by three categories of trade were derived by using the value of purchase as well as the value of sale as the weights. Using these two sets of values of weighted trade margins, two sets of figures for the gross earning <sup>1/</sup> of the households classified by ten commodity groups and by three categories of trade (i.e., wholesale, retail and others) were calculated (vide table 8, Appendix-II).

2.5 For the classification of households into different commodity groups particularly when a household pursued trading in commodities belonging to different commodity groups, the criterion of maximum value of sale was adopted. According to the procedures of calculating the gross earning of the trade households enunciated above, the value of gross earning per trade household <sup>in rural areas</sup> turned out to be Rs.46 per month by one procedure which differed only slightly when the weighting was done by the value of sales (Rs.46 per month). In the urban sector the average gross earning derived by both the procedures came out to be the same (Rs.129 per month).

---

1/ :  $G_{ij}(1) = P_{ij} \times T_{ij}(1)$  and  $G_{ij}(2) = P_{ij} \times T_{ij}(2)$  where  
 $T_{ij}(1)$  and  $T_{ij}(2)$  are weighted trade margins for  $i^{th}$  commodity group and  $j^{th}$  category of trade by using two different weights;  $P_{ij}$  is the estimated value of purchase by trade households belonging to  $i^{th}$  commodity group and  $j^{th}$  category of trade and  $G_{ij}(1)$  and  $G_{ij}(2)$  are gross earnings of  $i^{th}$  commodity groups and  $j^{th}$  category of trade by using  $T_{ij}(1)$  and  $T_{ij}(2)$  respectively.

some features of household non-registered trade

APPENDIX I

SAMPLING DESIGN AND ESTIMATION PROCEDURE

1. General - A stratified two-stage sampling design was adopted for the rural and urban sectors. While villages and blocks formed the first-stage sampling units for the rural and urban sectors respectively, households constituted the second-stage units for both the sectors.

A. Sampling Design and Estimation Procedure for Rural Sector

2. Stratification - The country was divided into 64 agricultural regions by grouping within each state or union territory, districts having similar population density and crop pattern. Strata were formed within each region by grouping contiguous tehsils having similar population densities and altitudes above sea level and having good transport and communication facilities amongst them such that the sum of the size measures of the villages was the same for each stratum within a state/union territory. The size of a village was the ratio of its population to the average population of a village in the population class 0-499 of the state rounded off to a suitable integer. The number of strata to be formed within a state/union territory was obtained by dividing the number of villages allocated to the state/union territory by 24 which was the number of sample villages selected from each rural stratum. The total number of strata was 350.

3. Allocation - The allocation of the total sample size of 8400 villages to each state/union territory was based on a joint consideration of its rural population, area under cereal crops and available investigator strength. This allocation was further modified to ensure a minimum sample size of 360 villages in each state (except Punjab and Haryana where the number of sample villages were only 192 and 144 respectively) and about 200 sample villages in the union territories of Manipur and Tripura and to make them multiples of 24 to have 4 sub-samples of 6 villages each in each stratum. Twentyfour villages were planned to be surveyed from each of the remaining union territories except Himachal Pradesh where a larger sample (72 in number) was envisaged for the survey.

4. Selection of villages - The 1961 census list of villages constituted the sampling frame for selection of villages. The villages in each state were categorised into four classes depending on the number of household manufacturing enterprises in them. Class 1 consisted of villages reporting at least  $X_1$  enterprises where  $X_1$  indicated the integral part of  $X/n$ ,  $X$  being the total number of enterprises and  $n$  the number of sample villages in the state. The villages having no enterprise at all were grouped under class 4 and the rest of the villages were then arranged according to the decreasing order of the number of enterprises in them. From the list of villages so ranked, class 2 was constituted by those villages from the top of the list which accounted for about half the number of enterprises belonging to

Contd.....

all the villages in the list. The remaining villages formed class 3. Within each stratum the villages were first arranged into the above-mentioned four classes and then within each class tehsils were arranged in a serpentine order considering geographical contiguity, the arrangement of tehsils being reversed in adjacent classes. Four independent sub-samples of 12 villages each were selected circularly systematically with probability proportional to size, size being related to population as mentioned earlier. In each sub-sample the villages with odd order of selection formed the Central Sample and the rest constituted the State Sample. The unit of selection was thus the 1961 census village, but the revenue village corresponding to the selected census villages was taken to be the unit of survey. If a stratum was too large and/or if good transport facilities were not available between some segments of it, then the stratum was divided into a convenient number of Investigation zones so that the area of each zone was of manageable size and more or less good transport facilities become available within each such zone. Two such zones were selected independently with probability proportional to their total size. Sub-samples 1 and 3 were selected from one zone and sub-samples 2 and 4 from the other.

5. Selection of hamlet groups - In case of some big sample villages the number of hamlet groups to be formed was specified before hand. In such villages the investigators were asked to form the specified number of hamlet groups of approximately equal population content. In each village, one of the hamlet groups was selected with equal probability for the survey.

6. Selection of households -- In the sample village/hamlet group, all the households engaged in non-registered (as per Sales Tax Act) distributive trade were enumerated. For the purpose of listing, a household was considered to be a 'trade household' if any member(s) of it was self-employed in trade either in principal or in subsidiary capacity. Households which were engaged in trade at any time during the last 30 days prior to the date of listing formed sub-stratum 1 and those engaged in trade during any day out of the 365 days, other than the last 30 days, preceding the date of listing constituted sub-stratum 2 of the frame. In general all the trade households belonging to sub-stratum 1 were surveyed. But in cases where the number of households of sub-stratum 1 exceeded 10, a linear systematic sample with a specified interval was taken for the survey. From sub-stratum 2 only one household was selected with equal probability.

7. Estimation procedure - The estimate of state total for any characteristic from a sub-sample belonging to sub-stratum 1 was derived as :

10. Arrangement of Towns - Before drawing the sample of blocks, the towns were arranged by stratum, region and the number of manufacturing establishments in the towns. The blocks within a town were then arranged according to their geographical contiguity.

11. Selection of blocks - The blocks within each stratum were selected circular systematically with probability proportional to size, the size of each block being taken as its population rounded off to the next multiple of 1000. The blocks were selected in the form of 4 independent and interpenetrating sub-samples. Each sub-sample had one-fourth of the sample size allocated to that stratum.

12. Selection of sub-blocks - For very big blocks sub-division was allowed to reduce the work load. The investigators were asked to divide the block into the specified number of sub-blocks having more or less equal population content. One sub-block was selected with equal probability for the survey.

13. Selection of households - In each sample block/sub-block, the households engaged in non-registered trade were categorised into 2 sub-strata as done in case of rural households. Further the households of sub-stratum 1 were arranged in two classes, viz., (i) those having trade as principal activity and (ii) those having trade as subsidiary activity. Then a sample of households was selected linear systematically with specified interval and random start from sub-stratum 1. From sub-stratum 2 only one household was selected with equal probability.

14. Estimation procedure - The estimate of state total for a characteristic from a sub-sample belonging to sub-stratum 1 was derived as :

$$Y = M \sum_{S=1}^K \sum_{i=1}^{n_s} \sum_{j=1}^{h_{si}} Y_{sij} \quad \text{where}$$

$Y_{sij}$  = the value of the characteristic for the  $j^{\text{th}}$  household of  $i^{\text{th}}$  block in  $s^{\text{th}}$  stratum,

$h_{si}$  = the number of sample households in  $i^{\text{th}}$  block of  $s^{\text{th}}$  stratum,

$n_s$  = the number of sample blocks selected per sub-sample of the  $s^{\text{th}}$  stratum,

$K$  = the total number of strata in the state; and

$M$  = the constant multiplier for sub-stratum 1 for the state.

15. All-India estimates and combined estimates of sub-samples. The all-India aggregate estimate was derived by summing the state estimates. Combined estimate of all the 4 sub-samples (comprising the total sample) were obtained by taking the arithmetic mean of the respective sub-sample estimates. The estimate of ratio was derived by dividing the aggregate estimate of the characteristic pertaining to the numerator by the corresponding aggregate estimate of the denominator.

- $Y_{sij}$  = the value of the characteristic for the  $j^{\text{th}}$  household of  $i^{\text{th}}$  village of  $s^{\text{th}}$  stratum.
- $h_{si}$  = the number of sample households in the  $i^{\text{th}}$  village of  $s^{\text{th}}$  stratum.
- $I_{si}^*$  = the Interval used for household selection in the  $i^{\text{th}}$  village of  $s^{\text{th}}$  stratum.
- $f_{si}^{**}$  = the adjustment factor for revenue village selection of the  $i^{\text{th}}$  village of  $s^{\text{th}}$  stratum.
- $Z_{si}$  = the village size used for selection of the  $i^{\text{th}}$  village of  $s^{\text{th}}$  stratum.
- $D_{si}$  = the number of hamlet groups in the  $i^{\text{th}}$  village of  $s^{\text{th}}$  stratum ( $D_{si} = 1$  if no such division was made)
- $I = \frac{Z}{6}$  = (where  $Z_s$  is the sum of village sizes in the  $s^{\text{th}}$  stratum) =  $\frac{Z}{6}$  (as  $Z_s = Z$  for all strata), is the common Interval used for selection of villages in the concerned state; and
- $K$  = the total number of strata in the state.

B. Sampling Design and Estimation Procedure for Urban Sector.

8. Stratification - In each state/union territory, towns with population less than 50,000 formed stratum 1 and the remaining towns and cities were categories under stratum 2 except the 4 big cities, viz., Bombay, Calcutta, Delhi and Madras. Each of the big cities formed stratum 3 of the respective states. The total number of strata was 44.

9. Allocation - The total sample size of 4632 blocks (Central Sample) was allocated to the states in proportion to their 1961 census urban population. The allocation was modified to ensure a minimum of 144 sample blocks in each state (with the exception of Punjab, Haryana and Nagaland having only 96, 72 and 24 sample blocks, respectively) and rounded off to multiples of 24. As far as the union territories were concerned, Goa, Daman & Diu, Himachal Pradesh and Pondicherry were given a quota of 24 blocks each while 40 sample blocks were planned to be surveyed in Manipur and Tripura. Delhi and Chandigarh had a larger share in the allocation having 120 blocks ear-marked for the survey. In allocating the total sample size to different states/union territories, available investigator strength and also the work load of the survey in rural areas were kept in view.

- \* $I_{si}$  = 1 where all the trade households in the sample village were surveyed.
- \*\* $f_{si}$  = 1 when the surveyed revenue village coincided with the selected census village or when the sample census village was taken as the unit of survey although census and revenue villages did not coincide.
- =r, when the surveyed revenue village was one of the 'r' revenue villages which were contained in the census village.
- =  $\frac{1}{r}$ , when the surveyed revenue village contained 'r' census villages, one of which was the sample census village.

APPENDIX - IV

List of Commodity Groups

<u>major group code</u>	<u>group code</u>	<u>c l a s s i f i c a t i o n</u>
1		<u>Food</u>
	01	cereals, pulses and preparations thereof
	02	sugar and gur
	03	diary products, bakery products, eggs preparations of meat and fish, sugar preparations, confectionery etc.
	04	meat
	05	fish
	06	edible oils and vanaspati
	07	fruits
	08	vegetables
	09	tea and coffee
	10	spices
	11	feeding staff for animals
	12	others
2		<u>Live animals</u>
	13	live animals excluding poultry
	14	poultry
3		<u>Tobacco and Beverages</u>
	15	tobacco
	16	intoxicants excluding tobacco
	17	tobacco products
	18	soft drinks
4		<u>Crude materials, inedible except fuels</u>
	19	hides, skins and furskins undressed
	20	oil-seeds, oil nuts and oil kernels
	21	crude rubber (including synthetic and reclaimed)
	22	wood, lumber and cork
	23	pulp and waste paper
	24	textile fibres (not manufactured into yarn, thread of fabrics) and their waste
	25	crude fertilisers
	26	crude minerals (excluding coal, petroleum and precious stones)
	27	metalliferous ores and metal scrap
	28	others

<u>major group code</u>	<u>group code</u>	<u>classification</u>
5		<u>Mineral fuels, lubricants and related materials</u>
	29	coal, coke, firewood etc.
	30	kerosene
	31	petroleum
	32	lubricants, furnace oils etc.
	33	gas, natural and manufactured
	34	electric energy
6		<u>Animal and Vegetable Oils and fats</u>
	35	animal oils and fats
	36	vegetable oils (inedible) and fats
	37	others like waxes of animal or vegetable origin
7		<u>Chemicals</u>
	38	chemical elements and compounds
	39	mineral tar and crude chemicals from coal, petroleum and natural gas
	40	dyeing, tanning and colouring materials (excluding paints)
	41	medicinal and pharmaceutical products
	42	essential oils and perfume materials; toilet, polishing and cleansing preparations
	43	fertilisers, manufactured
	44	explosives
	45	plastic materials, regenerated cellulose and artificial resins
	46	chemical materials and products n.e.s.
8		<u>Manufactured goods classified chiefly by material</u>
	47	leather
	48	leather manufactures n.e.s., and dressed furskins
	49	rubber manufactures n.e.s.
	50	wood and cork manufacturers (excluding furniture)
	51	paper, paperboard and manufactures thereof
	52	textile yarn
	53	textile products n.e.s.
	54	non-metallic mineral manufactures n.e.s.
	55	iron and steel
	56	non-ferrous metals
	57	manufactures of metal n.e.s.
9		<u>Machinery and transport equipment</u>
	58	machinery, other than electric
	59	electrical machinery, apparatus and appliances
	60	transport equipment and their spare parts (excluding bicycles, tricycles, rickshaws etc., not mechanically propelled)

<u>major group code</u>	<u>group code</u>	<u>classification</u>
0		<u>Miscellaneous manufactured articles</u>
	61	sanitary, plumbing, heating and lighting fixtures and fittings
	62	building materials excluding the items specified against group code 61
	63	furniture and fittings (steel)
	64	furniture and fittings (wood)
	65	ready-made garments
	66	footwear
	67	hosiery, raincoat, umbrella, head gear, other apparel etc.
	68	coir and jute products, mats, carpets and other made-up textile materials such as tarpaulin, tent, canvass goods etc.
	69	jewellery and precious stones
	70	books, periodicals, journals and other printed material
	71	exercise books, account books diaries and other office stationery articles
	72	glassware and crockery and outlary
