EMPLOYMENT-UNEMPLOYMENT SITUATION IN CITIES
AND TOWNS DURING THE LATE SEVENTIES

INTRODUCTION

1.1 The National Sample Survey Organisation (NSSO), in its tabulation scheme for the data collected through the survey on 'Employment and Unemployment' during the 32nd round (July 1977-June 1978), had included some key tables on employment and unemployment, separately for each of the 8 cities with the 1971 population one-million or more and three other size classes of towns for each state. In this report, are presented, ~~the 8 cities and other towns at all-India level~~ those key tables for ~~xxxxxxxxxx~~ Attempts have also been made to high light the differentials obtained in 'employment' as well as 'unemployment', in the metropolitan cities and in different size classes of towns during 1977-78.

1.2 The results are presented separately for the cities of Greater Bombay, Calcutta,* Madras*, Delhi*, Hyderabad, Bangalore, Ahmedabad, Kanpur and three groups of towns namely, i) those with 1971 population less than 50,000 (size class-I); ii) those with 1971 population 50,000-2,00,000 (size class-II) and iii) those with 1971 population 2,00,000-10,00,000 (size class-III).

1.3 The details of sampling design, survey coverage, estimation procedure and salient features of the conceptual frame and data collection procedure adopted in the survey are presented in the report containing detailed results relating to all-India. A brief summary of the scope and coverage of the survey, concepts and definition etc. is given below.

1.4 Geographical coverage for urban areas: The survey covered the entire urban area of the Indian Union excepting the urban areas of Sikkim, Andaman & Nicobar Islands and Ladakh district of Jammu & Kashmir.

* Includes the area under the respective urban agglomerations.

1/ Report on the second quinquennial survey on Employment and Unemployment (all-India) : Sarvekshana, Vol.V, Nos. 1 & 2.

1.5 Sampling design and Sample size : A stratified two-stage sampling design was adopted in the survey for urban areas with urban blocks (Urban Frame Survey blocks formed by NSSO) as the first stage units and households as the second stage units. Altogether 4940 urban blocks were selected as the first stage units. In each of the selected first stage units, 12 households were selected as second stage units.

1.6 Survey period and sub-round formation: The survey was started in July 1977 and was completed in June 1978. The entire survey period of one year was divided into four sub-rounds of three months each coinciding approximately with the four agricultural seasons. The four sub-round periods were July to September 1977, October to December 1977, January to March 1978 and April to June 1978. The sample blocks were distributed over the four sub-rounds in equal numbers so as to provide valid estimates for each of the sub-rounds.

1.7 Estimation procedure : In order to reduce work-load at the tabulation stage and to provide estimates at the regional level, the following estimation procedure was adopted :

$$Y = Y \times \frac{P}{p} \text{ -- where}$$

Y = estimated total of a characteristic for any city/size class of towns for any sub-round/
all sub-rounds

Y = sample total of the characteristic for the city/size class of towns for the sub-round/
all sub-rounds

P = projected urban population of the region(s)
(to which the city/size class of towns belong)
for January 1978 and

p = total sample persons in the sample blocks of
the region(s) ((to which the city/size class
of towns belong) surveyed in the sub-round/
all sub-rounds.

1.8 Salient features of the conceptual frame and data collection procedure : The main objective of the survey was to measure, in quantitative terms, the nature and extent of employment and unemployment at disaggregated levels. To achieve this

objective, the attempt in the survey was to classify the population as belonging to different activity categories independently, by using three different approaches, namely, (i) the usual status approach, (ii) the current weekly status approach and (iii) the current day status approach. Persons distributed according to the various activity categories were further classified by several meaningful correlates, such as age, sex, general and technical education, industry, occupation etc. The different activity categories, adopted for the purpose, were as under.

Description of activity category*	Category code
working with an employer under obligation but work not specifically compensated by any wage/salary	01 - 04
Worked (self employed) in household enterprises	11
Worked as helper in household enterprises	21
Worked as regular salaried/wage employee	31
Worked as casual wage labour in public works	41
Worked as casual wage labour in other types of work	51
Did not work though there was work in household enterprise	61
Did not work but had regular salaried/wage employment	71
Sought work	81
Did not seek but was available for work	82
Attended educational institutions	91
Attended domestic duties only	92
Attended domestic duties and was also engaged in free collection of goods (vegetables, roots, fire-wood, cattle feed, etc.), sewing, tailoring, weaving, etc., for household use	93
Too young to work/to attend school/to seek employment	94
Old and disabled	95
Rentiers, pensioners, remittance recipients, etc.	96
Beggars, prostitutes etc.	97
Others	98
Did not work due to temporary sickness (for casual workers only)	99

* The activity category codes 61, 71, 82 and 99 were used only for current status approaches.

Persons assigned any one of the activities listed under the category codes 01 to 71 were treated as 'working' (or employed). Persons assigned activity category codes 81 or 82 were treated as 'seeking and/or available for work' (or unemployed). The remaining persons i.e. the persons assigned any of the activity category codes 91 to 99 were treated as 'not available for work' (or not in labour force). The data on activity particulars of the persons were, however, tabulated only for population of age 5 years and above.

1.9 Classification according to usual status approach : For classification of population into various activity categories according to usual status, persons were first classified into three major activity status groups, namely, 'working', 'seeking and/or available for work' and 'not available for work' on the basis of a major-time-spent criterion with reference to a period of 365 days preceding the date of survey. Accordingly, one was categorised as 'working' if one was reported to be engaged for a relatively longer time during the reference period in one or more of the gainful activities (category codes 01-51), 'seeking and/or available for work' if one was reported to be either 'seeking or available for work' (category code 81 or 82) for a relatively longer time during the same reference period and 'not available for work' if one was reported to be not available for work during a relatively longer time of the reference period. Within each of these three broad groups of categories, the detailed activity status categories were then determined again by using the major-time-spent criterion.

1.10 Classification according to current weekly status approach: For classification of persons according to current weekly status, her or she had to be assigned a unique activity status with reference to a period of seven days preceding the date of survey. For a person pursuing more than one activity during the week, his/her unique status was decided by adopting a priority-cum-major time rule. Under the priority rule, the status of 'working' got priority over the status of 'not working but seeking/available for work' which in turn got priority over the

status of 'not working and not seeking/available for work'. For a person classified under the first or the last category, his/her detailed activity status was determined by major-time-spent criterion i.e. the detailed activity on which major time was spent was considered as his/her current weekly status. Further, if a person had worked for one hour on any one day of the week, he was considered as 'working'. A person who had not worked during the week but was available for work even for one hour on any one day of the week, was considered as 'seeking and/or available for work'. Others constituted the category 'not available for work' (or not in labour force). Each person was thus assigned a unique activity status for the week. Aggregate of persons under the different activity status provided the distribution of persons by activity on an average in a week of the survey period of one year.

1.11 Classification according to current day status approach :

In adopting the current day status approach attempt was made to account for two major activities pursued by a person on each day of the seven days/^{of the} reference week allocating 'half day' to each activity. The unit of classification according to this approach, was thus half day though data were collected for all the seven days of the reference week. In assigning the activity status on a day, a person was considered as 'working' (or employed) for the entire day, if he/she had worked for 4 hours or more on the day, and assigned the one or two (as the case may be) work activities (01-71) to which he/she devoted the working time. But if the work was done for one hour or more but less than 4 hours, he/she was considered as 'working' (or employed) for half day and 'seeking/available for work' (or unemployed) or 'not available for work' (or not in labour force) for the other half of the day, depending on whether he/she was seeking/available for work or not on the day. On the other hand, if a person was not engaged in any gainful work even for one hour on the day but was seeking or available for work for four hours or more, he/she was considered as 'unemployed' for the entire day. But if the reported availability for work was for less than four hours only, he/she was considered as 'unemployed' for half day and 'not in labour force' for the other half of the day. A person who neither was having any gainful work to do nor

was available for work even for half of the day was considered as 'not available for work (or not in labour force)' for the entire day and assigned xx one or two of the non-gainful activity status which he/she had during the day. The aggregate of person-days so classified under the different activity categories for all the seven days of the week divided by seven gave the distribution of persons (strictly speaking, person-days) by activity category on an average on a day of the survey period of one year.

1.12 Probing questions : In order to understand the complex dimensions of the work pattern, the extent of under utilisation and the nature of reported preferences for additional work etc. among those classified as employed according to usual status, the types of work desired, efforts made to get work etc. for those classified as 'unemployed', students, persons engaged in domestic duties etc., some relevant probing questions were put to the above categories of persons to elicit the required information. These probing questions apart, a second set of probing questions were also canvassed in this round exclusively for those classified according to usual status as engaged in domestic duties with a view to eliciting information on the reasons for their usual attachment in household chores, whether they would report as available for work if work was provided at their residences etc.

1.13 Activity category 93 : It is known that a part of the women usually engaged in household duties is spent on certain activities to meet household needs. These activities are considered gainful if the goods or services produced as a result of such work are essentially for sale. It was generally felt that information on this aspect of participation in household activities of persons, mostly women, classified according to usual status as 'engaged in domestic duties' could not be obtained from the NSS surveys. In the 32nd round survey, therefore, attempt was made to sub-divide persons who usually remain predominantly engaged in domestic duties into two sub-categories, namely, (i) engaged exclusively in domestic duties and (ii) engaged in domestic duties as well as in the activities like free collection of fish, small games etc. ~~XXXXXXXXXXXX~~ The adoption of this new activity sub-category for those engaged in household chores was intended to identify separately those who along with their domestic duties also carry out the above activities from those who carry out only domestic duties.

2 BACK GROUND DATA

2.0 In order to have a meaningful study of the differential in 'employment' and 'unemployment' over the various groups of population belonging to the different geographical locations, some background data on the households and population are presented in this section. The relevant data are given separately for the eight different cities and the three other size classes of towns compared against the pattern obtaining for rural and urban India.

2.1 Distribution of households by means of livelihood : It is known that 'self-employment' is the major means of livelihood of a large number of Indian households - both rural and urban. The 32nd round results have revealed that for more than one half of the rural households and as much as one third of the urban households, the major income from gainful occupations is derived from self-employment. That, even in the big cities and towns also a good proportion of households depend on self-employment is indicated by the results presented in table (1) which gives the proportion of self-employed households by the various size classes of towns. Amongst the eight 'million plus' cities, the proportion of self-employed households is least in Bombay (21 p.c.) and highest in Delhi and Hyderabad (32 p.c.) followed by Kanpur (30 p.c.). In the towns with population more than two hundred thousand but less than a million, the proportion of self-employed households is almost similar to that obtaining for Delhi, Hyderabad and Kanpur. In the towns with population less than fifty thousand, the proportion is almost 39 p.c. In column (4) of the table is given the average household size. It is seen that household size is highest for

Hyderabad (5.5) closely followed by Bangalore (5.3) which are even more than the all-India average for rural areas (5.2).

Table (1) : Proportions of 'self-employed' and 'other' types of households, average household size and average number of economically active persons per household

city/size class of towns	percentage of		house- hold size	no. of eco- nomicallly active persons per h.h.
	self- employ- ed h.hs.	other h.hs.		
(1)	(2)	(3)	(4)	(5)
Bombay	21.05	78.95	4.5	1.7
Calcutta	24.66	75.34	4.6	1.8
Madras	23.77	76.23	4.9	1.8
Delhi	32.18	67.82	4.6	1.7
Ahmedabad	23.08	76.92	4.9	1.5
Kanpur	30.29	69.71	4.9	1.6
Hyderabad	31.89	68.11	5.5	1.8
Bangalore	24.60	75.40	5.3	1.8
Size class 3	31.98	68.02	5.0	1.7
Size class 2	34.43	65.57	4.9	1.7
Size class 1	38.58	61.42	5.0	1.7
Urban India	33.48	66.52	4.9	1.7
Rural India	56.71	43.29	5.2	2.1

2.2 Distribution of population by age : In the subsequent sections are presented the data on employment and unemployment situation obtaining for the population of age 5 years and above. As a background frame, therefore, the distribution of population of age 5 years and above is presented by age-group and sex in table (2). The table also gives the proportion of children in the age-group 0-4 years and number of women per thousand men. The proportion of children in the age-group 5-14 is found to be the least in Calcutta and Bombay and highest in Ahmedabad and Kanpur. Another interesting feature is that the proportion of infants (age 0-4 years) is comparatively low in Calcutta and Bombay cities. The typical feature of male migration to big cities from nearby rural areas leaving their female folk back in the village homes for employment is revealed from the sex ratio presented in column (14) of the table. The male concentration is highest in Calcutta with only about 771 females per thousand males as against the urban India average of 904. Closely on the heels of Calcutta are, the cities Kanpur and Bombay. The male and female ratio for the cities of Madras and Hyderabad is the same as that obtaining for rural India. The vast industrial belts existing in the cities of Calcutta, Kanpur and Bombay attracting male labour from the nearby areas may be the cause of the low male - female ratio observed for these cities.

2.3 Distribution of population by education : In table (3) are presented the percentage distribution of males and females of age 5 years and above by different levels of general education. Bombay again has a unique position in having the lowest proportion of illiterate persons-both males (10 p.c.) and females (24 p.c.) compared to other cities. At the other end, Kanpur and Ahmedabad are almost similar with 21-24 p.c. of the males and 42 p.c. of females being illiterates. The proportion of male graduates is highest in Delhi and Bangalore (11-12 p.c.) followed by Kanpur and Hyderabad (9-10 p.c.). Madras is found to have the lowest proportion of graduates-both males and females. Delhi is having the highest proportion of female graduates (8 p.c.) followed by Kanpur, Bangalore and Bombay (5 p.c.). The proportion of educated (secondary and above) males is over 30 p.c. in Bombay, Delhi, Hyderabad and Bangalore and less than 20 percent in Ahmedabad and Kanpur. For females, the educated is over 20 p.c. in Delhi and Bombay. The proportion of educated females is lowest in Ahmedabad ^{and} Madras compared to the other cities.

Table (3) : Percentage distribution of population of age 5 years and above by education and sex.

Anar.

3. EMPLOYMENT

3.1 It was mentioned in the introductory chapter that in order to bring to light the different dimensions of the activity situation obtaining for the Indian population, a large chunk of which depends on self-employment in agriculture and agriculture based industries, wherein work is seasonal and intermittent, NSS is adopting a three pronged approach for classification of the population. On the basis of the data collected through the three approaches, three different estimates of the rates of 'employment' or 'work participation' ~~xxxxxx~~ are generated - the 'usual status' (us) rates, the 'current weekly status (cws) rates and the 'current day status' (cds) rates*. Table (4) gives the three 'employment' rates for the population of age 5 years and above separately for males and females. In the case of males, it is seen that for the cities as well as the size class 3 and size class 2 towns, the respective usual status and current weekly status employment rates almost agree with each other indicating that most of the working male population belonging to these areas have 'work' almost throughout the year. It is true that most of the 'marginal' workers who are not categorised as 'usually working' according to the major time criterion adopted for classifying the population according to usual status approach, may have been counted as 'workers' according to current weekly status approach in view of the priority criterion adopted for the purpose. But the agreement in the two rates rules out the existence of many marginal workers amongst males in the cities. Even if there are a few, they are almost equal in number to those who are categorised as usually working but lapse into unemployment or withdraw from work force during the lean seasons. But size class 1 towns exhibit ~~xxxxxx~~ a pattern/closer to that obtaining/in rural areas - withdrawal from 'work force' by a section of the population during lean seasons. They obviously outnumber the set of marginal workers. In the case of females, the pattern obtained for males for the cities is observed for all cities and towns. In fact for Ahmedabad the current weekly status rate is found to be a little higher than the usual status rate indicating that in this area marginal workers amongst females are more and they outnumber those who withdraw from 'work force' during the lean seasons.

* For a detailed explanation of these rates see "Report on the second quinquennial survey on employment and unemployment, survey results-all-India", Sarvekshna Vol.V, Nos.1 & 2.

3.2 Comparing the current week and current day status rates, it is seen that the latter rates are less than the former in the case of males, for the cities of Madras, Kanpur, Hyderabad and Bangalore and all the different size classes of towns indicating that many persons in these cities and towns though have some work in a week, do not have work throughout the week. For females, this pattern is observed for all the cities and towns excepting Bombay, Calcutta, Delhi and Kanpur.

Table (4) : Percentage of persons (5 years & above) working according to usual status, current week status and current day status by sex.

city/size class of towns	male			female		
	usual status	current week status	day status	usual status	current week status	day status
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Bombay	58.79	58.41	57.96	11.49	11.57	11.41
Calcutta	60.62	60.56	59.10	8.60	8.98	8.53
Madras	55.82	55.09	52.17	12.20	11.68	10.98
Delhi	58.84	58.31	57.75	10.22	10.02	9.35
Ahmedabad	51.84	52.34	51.14	9.18	10.48	9.43
Kanpur	57.44	57.14	55.87	5.76	5.75	5.04
Hyderabad	52.67	52.45	51.18	12.49	12.35	11.18
Bangalore	53.42	52.92	50.40	11.21	11.41	10.71
Size class 3	55.85	55.24	53.19	12.54	12.91	11.57
Size class 2	54.75	54.30	52.16	13.92	14.42	12.55
Size class 1	56.16	54.94	52.48	16.83	16.82	14.18
Urban India	56.22	55.50	53.47	14.03	14.22	12.46
Rural India	62.25	60.20	56.55	28.82	26.90	22.56

3.3 Age-specific work participation rates : One of the two important factors on which 'employment' of a person depends upon is age. The other is education. The work force participation rate, therefore, is highly correlated with these two characteristics of the population. The age differential of the work force participation rates is brought out in table (5.1) for males and table (5.2) for females. It is seen from the tables that the proportion of workers amongst children (age 5-14) is the highest in Calcutta compared to the other seven cities both for males (about 6 p.c.) and females (about 4 p.c.). In the other cities it varies from 2 p.c. to 4 p.c. for male children and less than 1 p.c. to 3 p.c. for female children. In the smaller towns the proportion of male child labour is about 5-6 p.c. and female child labour about 3-4 p.c. Variation in the proportion of male workers in the age-group 15-29 years is found to be small for all the big cities and towns - the lowest usual status rate being 57 p.c. for Ahmedabad and the highest being 62 p.c. for Bombay and size class 3 towns. It is about 66 p.c. for small sized towns. The variation amongst cities and towns in the work participation rates of males of age 30-44 is found to be even smaller, the rates varying between only 97 p.c. to 99 p.c. Amongst males of age 60 years and above about 57 p.c. are found to be working in Kanpur and about 48 p.c. in Delhi. For the other cities the corresponding proportion varies between 34 p.c. to 37 p.c. The variation in female work participation rates, in all the age-groups, amongst the cities and towns is found to be high.

3.4 Education specific work participation rates : The proportion of workers amongst persons having different education levels i.e., education specific work participation rates are presented in table 6.1 for males and in table 6.2 for females. For both males and females the 'work participation' is found to be the highest amongst 'graduates and above' in all the cities and towns. For males it is as high as 91 p.c. in Ahmedabad. The lowest rate is 73 p.c. for Madras city. For high male work participation, graduates are followed by those with secondary level of education in all cities and towns barring Kanpur where those with

Table (5.1) : Age specific work participation rates of males of age 5 years and above.

middle level of education are found to have higher participation than those with secondary level of education. Amongst educated - secondary and above - the three work participation rates are found to be of the same order indicating that the workers amongst them have more or less regular employment. But for illiterates and those with education upto primary level, the current day status rates are found to be lower than the current weekly status rates in all the areas. Obviously, a section of the workers amongst them do not find employment on all the seven days of even a week.

3.5 Amongst female graduates, work participation rate is highest %) in Madras city. About 10 percentage points below Madras are Bombay and Bangalore cities followed by Delhi. Female work participation amongst graduates is found to be lowest in Kanpur and Ahmedabad. In most of the cities and towns, next to graduates, female work participation is found to be the highest amongst illiterates. In Ahmedabad and Bangalore cities, (about 12 p.c. for Ahmedabad and 15 p.c. for Bangalore), the participation amongst those with secondary level of education is almost of the same order as that of the illiterates. In Bombay city however the rate for the former category of females slightly exceeds the rate for the latter category. For females with the level of education middle or below, the work participation rate is found to be very low, varying between 2 p.c. to 7 p.c. for the different cities and towns.

4. UNEMPLOYMENT

4.1 The data collected adopting the three approaches for classification of population has enabled generation of three unemployment rates as in the case of employment rates. They are :

- i) proportion of persons unemployed for a relatively long time during a year or in other words chronically unemployed, (u.s. rates);
- ii) proportion of persons unemployed on an average in a week for at least some part of the week (c.w.s. rates) and
- iii) proportion of persons (strictly person-days) unemployed on ^{an} average during a day (c.d.s. rates).

These rates studied together will reveal the different facets of the unemployment situation, ~~XXXXXXXXXXXXXXXXXXXXXXXXXXXX~~ Table (7) below gives the three unemployment rates obtaining for the population of age 5 years and above separately for the eight million plus cities, three size classes of towns and rural and urban India by sex.

Table (7) : Percentage of persons (age 5 years and above) unemployed according to usual status, current week status and current day status by sex.

city/size class of towns	male			female		
	usual status	current		usual status	current	
		week status	day status		week status	day status
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Bombay	4.62	5.13	5.13	3.94	5.00	3.65
Calcutta	6.56	6.60	7.64	3.04	1.47	1.57
Madras	7.90	8.03	10.55	6.50	5.37	5.97
Delhi	3.74	4.27	4.43	4.83	4.43	4.42
Ahmedabad	3.10	3.10	4.03	1.32	1.07	1.07
Kanpur	3.08	3.27	4.08	1.16	0.49	0.50
Hyderabad	5.40	5.57	6.00	4.91	2.58	2.60
Bangalore	5.14	4.98	6.86	4.30	1.73	1.85
Size class 3	3.62	3.86	5.07	3.04	1.30	1.54
Size class 2	4.05	4.14	5.58	3.20	1.33	1.82
Size class 1	3.04	3.69	5.20	2.38	1.28	1.93
Urban India	3.90	4.25	5.55	3.03	1.75	2.12
Rural India	1.41	2.23	4.33	1.68	1.16	2.28

For Bombay, however, the current day status unemployment rate is found to be less than the current weekly status rate. It appears that a large number of women in the category of 'not working and available for work' belonging to Bombay city, do not report as unemployed on all the seven days of a week. They may be wanting to work only on selected days of a week, withdrawing themselves from labour force on other days. Even for other cities, this pattern may prevail amongst women belonging to a particular age-group or education level.

4.4 - Age-specific unemployment rates : The age-specific unemployment rates - usual, week and day status - are presented in table (8.1) for males and in table (8.2) for females. For both males and females, 'unemployment' is found to be highest for the persons in the age-group 15-29 years. For them, it is the most acute in the city of Madras, the usual status rate being as high as 20 p.c. for males and 15 p.c. for females. Madras city is followed by Calcutta for males (17 p.c.) and Delhi for females (11 p.c.). For males, in all age-groups, the difference between current week status and current day status unemployment rates is highly pronounced for Madras city compared to any other city indicating severe underemployment i.e., lack of employment for all the seven days of a week for those categorised as employed according to current weekly status approach. The severeness of the same malady for males is also indicated in Bangalore and the cities of Calcutta, Ahmedabad and Kanpur, though the extent is relatively less.

4.5. For females in all age-groups, the current day status unemployment rates are found to be less than the current week status rates for Bombay city. It indicates that a number of women belonging to all the different age-groups report as unemployed only on some days of a week while on the other days, they withdraw from labour force. For the cities of Calcutta, Hyderabad and Kanpur and the size class 3 towns, the usual status unemployment rates of all the different age-groups are found to be relatively much higher than the corresponding current status rates.

Table (8.1) Age-specific unemployment rates of males of age 5 years and above.

city/size class of towns	activity status	age group

Amar.							

4.6 Education specific unemployment rates : The education specific unemployment rates are presented separately for males and females in tables (9.1) and (9.2) respectively. For males 'unemployment' amongst graduates is found to be most severe in Madras city (17 p.c.), compared to any other city or town. Madras is followed by Calcutta about (10 p.c.). At the lower end are the cities of Ahmedabad and Bombay, their unemployment rate for graduates being only about 2 p.c. In the other cities, the rate is about 7 p.c. For all the cities and towns, male 'unemployment' is found to be the least among the illiterates. Amongst female graduates, unemployment is most severe in Delhi (26 p.c.) followed by Calcutta (17 p.c.), Bombay (15 p.c.) and Madras (14 p.c.). It is observed that for most of the cities, current day status unemployment rate is less compared to the corresponding current week status rates for educated (secondary and graduates) females. It appears ~~that~~ that a section of the educated urban females belonging to the metropolitan cities, prefer to work ^{on a part-time basis} /only/ ^{or} on a few selected days of a week. This trend is not found amongst the uneducated women (illiterates or those with the level of education only upto middle standard) except in the case of Bombay city.

5. UNDER EMPLOYMENT

5.1 It has been observed that the magnitude of open unemployment ^{is} for the population of age 5 years and above/of the order of 3-4 p.c. in urban India and less than 2 p.c. in rural India. The more serious problem is perhaps that of 'underemployment'. In the absence of availability of suitable regular jobs, people are compelled to pursue whatever work available to them in the capacity of 'self-employment' or 'casual wage labour'. The work thus pursued may not be round the year or sufficient in money terms. Even during a short span of time, like a week, persons may not get work on all the seven days.

Table (9.1) : Education specific unemployment rates of males of age 5 years and above.

city/size class of towns	activity status	general education

Amar.								

5.2 Underemployment of usually employed : A person is categorised as usually employed if he or she is found to be pursuing any gainful activity for a relatively long time during a period of one year. Persons thus labelled as employed may not be having work on all the weeks of the year. A cross classification of the usually employed by their current weekly status will give an average picture of the proportion amongst them who are currently employed and who are currently unemployed. The first category can be considered to have work almost throughout the year. The second category of the usually employed do not have work throughout the year and in that sense will constitute one type of 'underemployed'. Table (10) gives the distribution of usually working by their current weekly status for the different cities and towns compared against the urban and rural India distributions.

Table (10): Percentage distribution of persons usually working by current weekly status

city/size class of towns	male			female		
	working	unem- ploy- ed	not in labour force	working	unem- ployed	not in labour force

Rural India	95.50	2.01	2.49	83.36	2.98	13.66

Compared to other cities and towns, Madras records the highest proportion of underemployed amongst the usually employed, it being about 2 p.c. for males and 4 p.c. for females. For males Madras is followed by the cities of Bombay and Hyderabad whereas for females Hyderabad takes the second place and Bombay the third place. The proportion of underemployed amongst usually employed is least for Ahmedabad city.

5.3 Underutilisation of currently employed : According to current weekly status, any person who had pursued some gainful activity during a reference period of seven days is considered 'employed'. It is possible that many among the persons thus categorised as employed may not be working on all the seven days of the week due to non-availability of work or for other reasons. The typical pattern of underutilisation of the employed even during a short span of one week is revealed from table (11) which gives the distribution of persons who had pursued some work during a week by the number of days worked in the week. For males, about 13-14 p.c. of those categorised as currently working do not have work on all the seven days of the week in the cities of Madras and Bangalore. On the other hand for females, Ahmedabad and Kanpur have the highest proportion of underutilised (about 22-23 p.c.) work force.

Table (11): Percentage distribution of persons of age 5 years & above working according to current week status by number of days worked in a week.

5.4 Indirect measure of underemployed : The results presented in the above two tables do not reflect the magnitude of invisible underemployment obtaining for a large section of the working population. In order to get some idea of the extent of working population suffering from underemployment - both visible and invisible NSS 32nd round survey put some probing questions to all the persons categorised as 'working' according to usual status. One of the questions was "Are you available for additional ^{work}/?". An answer in the affirmative to this question, however subjective it may be, will give some idea of the extent of working population who want additional work, indicating that they do not have enough work either in terms of quantum of work or in terms of money return in the present occupation. Table (12) gives the proportion of 'usually employed' reporting availability for additional work. It is seen that the proportion of 'underemployed' is highest in the city of Madras (about 27 p.c. of both the usually employed males as well females have reported that they are available for additional work Madras is followed by Hyderabad and Bangalore, the proportion of underemployed being about 19-20 p.c. for male workers. For female the corresponding proportions are 24 p.c. in Hyderabad city and 16 p.c. in Bangalore. Bombay and Ahmedabad cities report lowest proportion of underemployed. The urge to undertake additional employment is more reflected amongst casual labourers, both males and females, in all the cities and towns.

Table(12): Proportion of 'usually working' who reported availability for additional work.

6. REGISTRATION IN EMPLOYMENT EXCHANGE

6.1 In many quarters it is still felt that the number of registrants in the Employment Exchanges, might indicate the volume of 'urban unemployment'. Attempts have been made in the past by various users to adjust the number of registrants for its known limitations to obtain an estimated indicator of 'urban unemployment'. The limitations are :

- i) all the unemployed may not register and most of the registrants may be aspirants of some sort of regular salaried/wage jobs;
- ii) all the registered may not be unemployed and some of them may be, in fact, already working and looking for better jobs;
- iii) some may be registering in more than one employment Exchange;
- iv) some rural job seekers may also be registering with the nearest urban Exchanges.

The information collected in the NSS 32nd round will help in obtaining factors for adjustment of registration data in lieu of the limitations (i), (ii) and (iv) listed above. NSS did not collect data on multiple registration status of job seekers as it was felt that reliable data might not be forthcoming on this aspect of registration.

6.2 In order to adjust the number of registrants to obtain some sort of an approximate measure of urban unemployment, it is first necessary to know, the breakup of registrants by their activity status - 'working', 'unemployed' and 'others' so that the first and last categories of registrants can be excluded from the total registrants. This will still leave the multiple and rural registrants. The rural survey data gives the proportion of rural registrants which may be used for adjustment in lieu of limitation (iv), but obviously that can be done only at total urban area level, either state or all-India, and not at individual city

or town level. The proportion of registrants amongst the 'unemployed' is also necessary for the final adjustment. In table (13) is given the percentage breakup of total registrants by current week status of the registrants (age 15-59 years), for the various cities and towns and also for rural India.

Table (13): Percentage distribution of registrants of age 15-59 years by current week status.

city/size class of towns	male			female		
	workers	unem- ployed	not in labour- force	workers	unem- ployed	not in labour force
(1)	(2)	(3)	(4)	(5)	(6)	(7)
Bombay	36.97	50.19	12.84	19.18	68.04	12.78
Calcutta	31.91	48.48	19.61	19.75	44.44	35.81

Delhi	47.29	36.60	16.11	18.75	72.54	8.71
Ahmedabad	53.13	28.12	18.75	10.00	40.00	60.00
Kanpur	49.77	34.25	15.98	-	19.05	80.95
Hyderabad	51.56	32.50	15.94	15.15	50.91	33.94
Bangalore	63.16	25.61	11.23	40.28	27.31	32.41
Size class 3	46.09	32.43	21.43	19.88	33.36	46.76
Size class 2	42.82	33.92	23.26	18.76	38.90	42.34
Size class 1	46.07	34.56	19.37	16.90	45.71	37.39
Urban India	44.50	36.09	19.41	18.62	45.26	35.42
Rural India	60.93	26.65	12.42	22.22	34.78	43.00

It is seen that in all the cities and towns excepting Bombay, the proportion of unemployed amongst the male registrants is less than 50 p.c. - it varying between 26 p.c. in Bangalore to 48 p.c. in Calcutta. It is just 50 p.c. in Bombay city. A good proportion of the male registrants are already working, may be as a stop gap activity, until they get better employment. It only shows that a section of the population cannot afford to wait for jobs to their liking and has to take up whatever 'work' is available to them and at the same time registering their names in the employment Exchanges for suitable opportunities. Compared

to males, the proportion of 'unemployed' amongst the registrants is higher for females, almost in all the cities and towns excepting in Kanpur and Calcutta cities. Surprisingly, at urban India level, 19 p.c. of the male registrants and 35 p.c. of the female registrants are found to belong to the 'not in labour force' category. Amongst the million plus cities, this proportion for males varies between 5 p.c. (Madras) and 20 p.c. (Calcutta) and for females between 9 p.c. (Delhi) and 81 p.c. (Kanpur). It may be that some of the registered may have given up the idea of working currently. Obviously, this factor alone cannot account for the high proportion of 'not in labour force' category amongst the registrants - particularly in the case of women. It may be that a number of students enrolled at higher educational levels may have also registered with the employment exchanges. Amongst females, the possibility of misclassification of persons engaged in household duties as 'house workers' in spite of their availability for work indicated through registration at the employment exchanges, cannot altogether be ruled out.

6.2 The proportion of registrants amongst the three broad categories (workers, unemployed and not in labour force) of population of age 15-59 years is presented in table (14). Only about 37 p.c. of the unemployed urban population (15-59 years) are found to have registered with the employment exchanges. It is thus clear, that a good proportion of the 'unemployed' do not register with the employment exchanges, may be because many of them may not be having the required educational or skill back ground to get any regular type of employment. Bombay and Ahmedabad cities record the lowest proportion of unemployed male registrants. For unemployed females, the proportion of registrants is lowest in the cities of Kanpur and Bombay. The response for registration is highest in Hyderabad for males and in Bangalore for females.

Table(14): Proportion of registrants of age 15-59 years amongst 'workers', 'unemployed' and 'others'.
