KEY RESULTS OF LAST THREE QUINQUENNIAL
NSS ENQUIRIES ON EMPLOYMENT-UNEMPLOYMENT.

Introduction

1.1 The National Sample Survey Organisation (NSSO), in its renewed efforts in the conduct of Employment-Unemployment surveys under a quinquennial work programme with changed conceptional framework, launched the first survey in the series during its 27th round programme covering the period October 1972 to September 1973. The second survey in the quinquennial series was conducted during the 32nd round covering the period July 1977 to June 1978. The third was carried out during the year 1983, as a part of the 38th round survey programme. In this brochure, comparable results on key characteristics of employment and unemployment as obtained from survey data of the three NSS rounds, 27, 32 and 38, are presented.

1.2 The survey period for the 38th round was the calendar year 1983. It was split into four sub-rounds each of which was of three months' duration. The total sample was selected in the form of four sets of samples, one set each to be surveyed in each sub-round. The entire sample was so selected that each sub-round sample would give an independent estimate for the country for the related period.

1.3 To meet the urgent need of important results within a few months after the completion of the survey, a set of tables relating to some key characteristics have been generated on a priority basis from the data collected in the first two sub-rounds of the 38th round survey (January - June 1983). Due to the urgency of requirement of end results, much time could not be provided for scrutiny and editing of the raw data. So, the results for 1983 are based on almost unscrutinised data of a part sample of NSS 38th round and therefore, only provisional.

1.4 Since the present results are based on the data relating to the first two sub-round period, comparable results for the

27th and 32nd rounds, particularly for the current employment and unemployment pattern, are worked out also for the corresponding periods (second and third sub-round period for 27th round and third and fourth sub-round period for 32nd round). The results pertaining to the usual work pattern, however, relate to the entire round sample for the 27th and 32nd rounds and in that respect, for those results, the sample size of 27th and 32nd rounds is almost double that of 38th round size.

1.5 Section 2 of this document gives briefly the scope, coverage and sample design of the 38th round. Salient features of the conceptual frame work adopted in the three rounds are presented in Section 3. Comparable summary results on key indicators of employment and unemployment obtained from the three rounds, 27, 32 and 38, are discussed in section 4. In the Appendix are presented tables giving distribution of population by activity status and industrial distribution of workers separately for males and females for all-India and states.

2. Scope, coverage and sample design of NSS 38th round.

2.1 Geographical coverage : The 38th round survey covered the whole of Indian Union excepting (i) Ladakh and Kargil districts of Jammu & Kashmir and (ii) Rural areas of Nagaland. The present results, however, exclude in addition to the above areas, also the states/union territories of Arunachal Pradesh and Lakshdweep.

2.2 Subject coverage : Apart from the regular price enquiry, two subjects - Employment-Unemployment and Consumer Expenditure were covered in this round. Schedules relating to the latter two subjects were canvassed from the same set of samples in order to have a meaningful correlated study of the employment-unemployment and level of living of the population.

2.3 Sample design : The sampling design adopted in the survey was a stratified two stage one with census villages in the rural areas and NSSO urban frame survey blocks in the urban areas as first stage units and households as second state units. The sample

villages were selected with probability proportional to size and with replacement in the form of two independent interpenetrating sub-samples (IPNS). Sample blocks were selected with equal probability also in the form of two IPNS. The sample households in the second stage (ten from each first stage unit) were selected circular systematically after arranging all the households of a first stage units in a specified manner.

2.4 Survey period and sub-round formation : The survey was started in the month of January 1983 and was completed in December 1983. The entire survey period of one year was divided into four sub-round periods of three months' duration coinciding approximately with the four agricultural seasons. The four sub-round periods were :

- sub-round 1 : January - March 1983
- sub-round 2 : April - June 1983
- sub-round 3 : July - September 1983
- sub-round 4 : October - December 1983

The samples were distributed over the four sub-rounds in a manner so as to provide equally valid estimates for the country for each of the related sub-round period. 38th round results presented in this report are based on the sub-rounds 1 and 2 pooled data .

2.5 Sample size : In all, the survey covered about 1.3 million households over about 8700 sample villages and 4570 sample blocks. The present results are based on about one half of the above sample.

2.6 Estimation procedure : The estimation procedure adopted in 38th round is based on a weighted sum of the sample values.

XX
XX Denoting by \hat{Y} the un-biased estimate of Y, (the state/region total of any variate) it is given by :

$$\hat{Y} = \sum_s \frac{P_s}{n_s} \sum_i \frac{D_{si} e_{si}}{p_{si}} \cdot \frac{H_{si}}{h_{s1}} \sum_j Y_{sj1} \dots \dots \dots (1)$$

for the rural sector except Arunachal Pradesh and

$$\hat{Y} = \sum_s \frac{N_s}{n_s} \sum_i D_{si} \frac{H_{si}}{h_{si}} \sum_j Y_{sij} \dots\dots\dots (2)$$

for the urban sector as well as for rural sector of Arunachal Pradesh, where,

s, i and j are suffixes for stratum, village/urban block and household respectively;

N_s and n_s give the stratum values of selection population, number of villages/blocks in frame and number of sample villages/blocks respectively;

D_{si} , e_{si} , p_{si} stand for respectively, number of hamlet-groups/ sub-blocks formed, number of census villages contained in a larger revenue village actually surveyed and the selection population of the sample village;

H_{si} and h_{si} stand for the total number of households listed and number of sample households;

and finally y is the observed value of the variate for a sample household.

Sub-sample-wise (also sub-round-wise) estimates of Y are obtained by restricting the summation (\sum) to units belonging to the concerned sub-sample with n_s representing the number of such units.

Estimates of ratios such as percentages, averages etc. are obtained by first calculating the unbiased estimates of the numerators and denominators concerned and then by division.

3; Salient features of the conceptual frame and procedure of Data Collection.

3.1 In all the three quinquennial surveys on employment-unemployment carried out during the 27th, 32nd and 38th rounds, the main objective was to measure the nature and extent of employment and unemployment in quantitative terms disaggregated by meaningful correlates, such as, sex, age, education, residence status etc. To achieve this objective, the attempt in all the

three surveys was to classify the population of age 5 years and above as belonging to different activity categories adopting three different approaches namely

- i) usual status approach with a reference period of 365 days preceding the date of survey;
- ii) current week status approach with a reference period of 7 days preceding the date of survey and
- iii) current day status approach, reference period being each day of ^{the} 7 days preceding the date of survey.

The various activity categories used in the 32nd and 38th round surveys were as under*

*Though the activity categories used in the 27th round differed from ^{those} used in the latter rounds, comparison was possible at certain activity category group levels.

<u>code**</u>	<u>description</u>
01-04	working with an employer under obligation but work not specifically compensated by any wage/salary
11	worked (self-employed) in household enterprises
21	worked as helper in household enterprises
31	worked as regular salaried/wage employee
41	worked as casual wage labour in public works
51	worked as casual wage labour in other types of work
61	did not work though there was work in household enterprise
71	did not work but had regular salaried/wage employment
81	sought work
82	did not seek but was available for work
91	attended educational institutions
92	attended domestic duties only
93	attended domestic duties and was also engaged in free collection of goods (vegetables, roots, fire-wood, cattle feed, etc.), sewing, tailoring, weaving etc., for household use
94	too young to work/to attend school/to seek employment
95	old and disabled
96	rentiers, pensioners, remittance recipients, etc.
97	beggars, prostitutes, etc.
98	others
99	did not work due to temporary sickness (for casual workers only)

**Codes 61, 71, and 99 were applicable only in the case of current week and day status approaches.

Persons reported to be engaged in any one or more of the activities listed under the category codes 01-71/^(01-51 for usual status)during the specified period were considered 'working' (or employed). A person assigned the activity category code 81 or 82 was considered 'seeking and/or available for work' (or unemployed). The two together constituted the 'labour force'. Any person reported to be engaged in one or more of the activities under the category codes 91-99 was classified as 'not in labour force'.

3.2 Classification according to usual status approach : In the 38th round survey, the status of activity (or inactivity) on which a person spent relatively longer time of the preceding 365 days prior to the date of survey was considered the principal usual activity status of the person. Accordingly, a person's principal usual status was considered 'working' (or employed), if he/she was engaged relatively for a longer time during the reference period of 365 days in any one or more work activities viz., activities coded 01-51, 'seeking or available for work' (or unemployed), if he/she was not working but was either seeking or was available for work (activity code 81) for a relatively longer time of the specified reference period and 'not in labour force' if he/she was engaged for a relatively longer period in any one or more of the non-gainful activities (activities coded 91-98). Within the two broad activity categories, 'working' and 'not in labour force', the detailed activity category was determined on the basis of time spent criterion. A person categorised as a 'worker' on the basis of his/her principal status is referred to herein after as 'main worker'. Those of the 'non-workers' who pursued in a subsidiary capacity some gainful activity as well, along with their principal usual activity (non-gainful) are herein after referred to as 'marginal workers'. These two groups viz. 'main workers' and 'marginal workers' together constitute 'all workers'. The same concept was adopted in the NSS 32nd round also, for classification of population according to usual status. In the 27th round survey, however, for a person, his or her activity (or inactivity) which dominated for a long period of time in the past

*The concepts of 'main/marginal' worker used in NSS are not strictly the same as those of the 1981 census.

(say, one year or so) and which also was likely to continue in the future was considered as his/her usual activity. Accordingly, a person was considered 'working' if he/she was pursuing any gainful activity for a long period in the past, say one year, which was likely to continue in the future also. Even persons (excepting full time regular students) who were pursuing gainful activities marginally only, were considered as workers. Thus, the estimates of usual 'workers' based on the 27th round data included both the categories of workers, those pursuing gainful activities in the principal capacity and those pursuing gainful activities in the subsidiary capacity, or in other words both 'main' and 'marginal' workers. The estimates of workers - main & marginal - taken together as obtained from the 32nd and 38th rounds would, thus, be comparable with the estimates of 'workers' as obtained from the 27th round.

3.3 Classification according to current weekly status approach:

For classification of persons according to current weekly status, he/she had to be initially assigned a unique activity status with reference to a period of 7 days preceding the date of survey. This posed no problem in the case of persons having only one status during the reference week. But for persons pursuing more than one activity during the week, their classification under a unique status was made by adopting a priority-cum-major time rule. Under the priority rule, the status of 'working' got priority over the status of 'not working but seeking/available for work' and the status of 'seeking/available for work' got priority over the status of 'not working and not seeking/not available for work'. But for classification of a person categorised according to the priority criterion under the broad status category 'working' or 'not working' the detailed activity category status which would be assigned to the person was determined by major time criterion i.e. the detailed activity category on which major time was spent was considered his/her current weekly status. Thus, a person was considered 'working' (or employed) if he was engaged in any one or more of the gainful activities (01-71) at least one hour on any one day of the reference week but was assigned that out of the different gainful activities (01-71) on which his major working time was spent during the reference week. A person who had not worked for at least one hour on any one day of the week, but had been seeking work or had been available for work (although not seeking) at any time during the week was considered 'seeking/available for work' (or unemployed). Others were considered 'not available for work'

(or not in labour force). Each member of the sample household was, thus, assigned a unique activity status for the week. Aggregates of persons under the different activity status thus assigned provided the distribution of persons by activity on an average in a week of the survey period of one year.

3.4 Classification according to current day status approach*:

The activity pattern of the population particularly in the unorganised sector is such that a person might be pursuing more than one activity during a week and sometimes even during a day. Many people - particularly women - might undertake nominal work in their household enterprises along with other non-gainful activities, thus pursuing both gainful and non-gainful activities on the same day. According to 'current day status approach', therefore, each person was assigned one single activity status or two at the most on each day of the reference week depending on whether he had been pursuing one or more than one activity on each of the seven days of the reference week. The unit of classification was, thus, half day according to 'current day status' approach. In assigning the activity status on a day, a person was considered 'working' (employed) for the entire day if he had worked 4 hours or more on the day. But if he worked one hour or more but less than 4 hours he was considered 'working' (or employed) for half day and 'seeking/available for work' (unemployed) or 'not available for work' (not in labour force) for the other half of the day depending on whether he was seeking/available for work or not, on the day. On the other hand, if a person was not engaged in any gainful work even for one hour on the day but was seeking or available for work for four hours or more he was considered 'unemployed' for the entire day. But if he was available for work for less than four hours only he was considered 'unemployed' for half day and 'not in labour force' for the other half of the day. A person who was having neither any gainful work to do nor was available for work even for half of the day was considered 'not in labour force' for the entire day and assigned the one or two of the non-gainful activity statuses which he had during the day. The aggregate of persons classified under the different activity categories for all the seven days of the week divided by seven would give the distribution of persons (strictly person-days) by activity category on an average day over the survey period of one year.

*This was termed 'labour time disposition' in the 27th round.

4. Results

4.0 Based on the data collected through the three approaches adopted by NSSO in its quinquennial surveys on employment and unemployment, three different estimates of 'employed' and 'unemployed' are obtained for the population of ^{age} 5 years and above. The three estimates are :

- i) number of persons usually employed/unemployed
- ii) number of persons employed/unemployed on an average in a week and
- iii) number of persons employed/unemployed on an average in a day

4.1 Usual work pattern : It was already mentioned that in the 32nd and 38th round surveys, usual status of a person was determined on the basis of a 'relatively longer time spent' criterion with reference to a period of 365 days preceding the date of survey. Thus, the estimate of 'usual status work force' obtained on a classification of population adopting the time criterion used in the 32nd and 38th rounds, would indicate the extent of persons working relatively for a longer time during a period of 365 days or in other words, say, 'main workers'. However, the additional information collected in these two rounds on the subsidiary work status of persons initially categorised as 'non-workers' had enabled NSS to obtain estimates of usual 'marginal workers'. These two estimates of workers - main and marginal - taken together obviously give the total extent of 'workers' which it is expected would be comparable with the estimates of 'workers' as obtained from the NSS 27th round, wherein, a usual worker was defined as one who was engaged in gainful pursuits for a long past (say, 365 days preceding the date of survey). Obviously, the estimate of 'workers' as obtained from 27th round included both the main and marginal workers. In tables (1) are given the comparative estimates of usual 'work force' as obtained from the three rounds for all-India.

Table (1) : Percentage of persons of ^{age} 5 years and above usually working as obtained from the three NSS rounds for all-India by sex and residence status.

round & type of work force*	rural		urban	
	* male	female	male	female
(1)	(2)	(3)	(4)	(5)
27-main & marginal	63.84	37.53	57.09	15.53
32-main only	62.25	28.82	56.22	14.03
32-main & marginal	64.06	38.48	57.48	17.80
38-main only	61.10	28.38	56.29	13.81
38-main & marginal	63.23	38.74	57.71	17.31

*27th and 32nd round estimates are based on all the four sub-round data while 38th round estimates are based on only the first two sub-round data.

The work force participation level of males, both rural and urban, is found to be almost constant throughout the ten year period 1972-73 to 1983, it being about 63 to 64 percent for rural males and about 57 to 58 percent for urban males. On the other hand, while for rural females it remained almost constant at about 38 percent level, for urban females there appears to be a slight increase in the late seventies and early eighties compared to the early seventies. The proportion of marginal workers is only of the order of about 2 percent amongst rural males and about 1 percent amongst urban males. Unlike males, in the case of females as high as about 10 percent of them are found to be working only in a marginal capacity in rural areas. The proportion of marginal workers amongst urban females is comparatively less, being about 3-4 percent.

4.2 Composition of work force : For a person classified as 'working', additional information was being collected in the surveys on the type of employment in which the person was engaged, related sector of industry, type of job function etc. Three broad categories of employment were used, for further classification of workers namely, (i) self-employment (ii) regular wage/salaried employment and (iii) casual wage labour. In table (2) are presented the percentage break downs of all workers (main & marginal) by the above three categories of employment as obtained from results of the three quinquennial rounds of surveys. In rural area, both in the case of males as well as females there has been a fall in the self-employment opportunities in the recent years compared to early seventies. The proportion of self-employed rural males in the total rural male work force was 66 p.c. in 1972-73 which fell to 63 p.c. in 1977-78 and to 60 p.c. in 1983. In the case of rural females, from 64 p.c. in 1972-73 the proportion of self-employed fell to 62 p.c. in 1977-78 which remained constant in the subsequent years. The proportion of regular wage/salaried earners also declined during 1977-83 period compared to 1972-73 year both for males and females in the rural areas. Naturally, casual wage labour has increased in the later years. For urban males, whereas, the proportion of 'self-employed' has been observed to be steady over the years there has been a fall in the regular wage/salaried employment opportunities over time. This has obviously caused an increasing trend in the portion of casual wage labour amongst urban male work force. For urban females, there has been, however, an

Table (2) : Distribution of all workers (main plus marginal) according to usual status by category of employment separately for males and females in rural and urban India.

category of employment	male			female		
	round			round		
	27th	32nd	38th	27th	32nd	38th

self-employment	65.90	62.77	60.40	64.48	62.10	62.21
regular wage/ salaried work	12.06	10.57	10.77	4.08	2.84	3.10
casual wage labour	22.04	26.66	28.83	31.44	35.06	34.69
<u>u r b a n</u>						
self-employment	39.25	40.38	40.67	48.40	49.47	46.50
regular wage/ salaried work	50.60	46.41	44.58	27.89	24.94	26.23
casual wage labour	10.06	13.21	14.75	23.71	25.59	27.27

increase in the portion of self-employed during 1977-78 compared to 1972-73 and then a fall in the subsequent years. Opportunities for regular employment for them, fell during 1977-78 and then improved in the subsequent years. The overall effect was an increasing trend in casual wage labour over the ten year period.

4 3 Industrial distribution of work force In all the three quinquennial surveys, for each person categorised as a worker, information relating to the sector of work (industry) in which the person was employed, was also collected in detailed break downs. In table (3) is presented the distribution of all workers (main & marginal) according to usual status by the broad industry (division level) as obtained from the 27th, 32nd and 38th round survey data. In rural areas, over two-thirds of the male workers and nearly 90 p.c. of the female workers are found to be engaged in the activities relating to agricultural sector including hunting, forestry and fishing. But over the 10 year period, 1973-83 there has been a steady fall in the extent of workers in the agricultural sector, from 83 p.c. in 1972-73 to 77 p.c. in 1983 for males and 90 p.c. in 1972-73 to 87 p.c. in 1983 for females. This fall has been absorbed mainly by activities relating to manufacturing, 'trade' and 'community, social and personal services'. Amongst the urban male workers, a little over one quarter are engaged in 'manufacturing' activities and around one-fifth, each in the activities relating to 'trade' and 'community, social & personal services'. There appears to be a fall by about 3 p.c. levels in the proportion of urban male workers engaged in 'social, community and personal services' during the late seventies and early eighties compared to early seventies which has been absorbed a little each by other sectors excepting agriculture and trade. As regards urban females, an increased participation in the activities of 'manufacturing' and 'trade' is observed in the later years compared to early seventies. The corresponding fall in participation has occurred in the 'agricultural' sector.

4.4 Current status work force participation rates . It was seen from table (2) that the usual pursuits (judged on the basis of 'time') of a very high proportion of the rural work force are activities relating to agriculture. Naturally, those persons engaged in the activities of agriculture and agriculture based industries are likely to change their usual vocations during the lean seasons in agriculture. Some may temporarily take up jobs relating to other sectors, some may become unemployed and some may even remain outside the labour force. This pattern may change for an individual from one week to another during a particular season or from one day to another day of even a week. These intermittent changes in the activity pattern of the population are not brought out by the estimates thrown up by the data obtained through usual status approach. The work pattern on an average obtaining for a week is given by the 'current week status' estimates and the pattern obtaining on an average for a day is given by the 'current day status' estimates.

4.5 Estimates of 'work force' according to 'current week' and 'current day' status approaches : The current week status estimates indicate the average picture of the extent of 5 + population who had pursued some economic activities in a week. The current day status estimates give the picture of the volume of 5 + population in terms of person-days who had pursued some work, on an average, in a day. The relevant comparative estimate as obtained from the three rounds (27th, 32nd and 38th) are presented in table (4) separately by sex and rural - urban residence status. (The estimates presented in the table for the 27th, 32nd and 38th rounds relate to the same period 'January to June' respectively of the years 1973, 1978 and 1983.)

Table (4) : Percentage of persons of age 5 years and above 'working' according to 'current week' and 'current days' status approaches

ALL-INDIA				
round	current week status		current day status	
	male	female	male	female
(1)	(2)	(3)	(4)	(5)
		<u>rural</u>		
27	61.42	30.52	57.99	25.22
32	59.94	25.92 ¹	56.12	21.63
38	58.98	25.02	55.43	21.76
		<u>urban</u>		
27	56.34	13.98	54.72	12.19
32	56.05	14.75	54.13	13.00
38	56.02	13.81	53.77	12.49

It is seen that on an average around 60 p.c. of the rural males and a little over 55 p.c. of the urban males have some work in a week during the January - June period. While for the urban males, the work participation rate is found to be almost constant during the period 1973-83, for rural males, there has been slight fall in the participation rate over the years (from 61.42 p.c. in 1973 to 59.98 p.c. in 1983). For urban females, around 14 p.c. of them are found to have some work in a week during January - June period. This proportion is found to be almost steady over the 10 year period beginning in 1973. But for rural females there appears to be a fall in the weekly status work participation rate during the period 1977-83 compared to 1972-1973. In fact the rate has fallen from nearly 31 p.c. in 1973 to around 25 p.c. during 1977-83. NSS, in an earlier report*, reviewing the comparable results obtained from the 27th and 32nd round data had brought out that this fall in 1977-78 compared to 1972-73 might have been due to the introduction of a new activity sub-category for persons engaged in domestic duties which might have led to misclassification of some rural females mainly engaged in house chores

*Employment-Unemployment situation in India during the seventies - A comparative study based on the results of the NSS 27th and 32nd round surveys, Sarvekshana, Vol.III, No.3.

along with some economic pursuits which were nominal or marginal in nature, as 'house workers' in the 32nd round.

4.6 As pointed out earlier, the week status rates do not reflect the fluctuations in employment within a week. In fact the week rates tend to overestimate employment. The day status rates, therefore, depict a more realistic picture of the real pattern of the employment-unemployment situation. It is seen that in rural areas for both males and females, the day status work force participation rates are lower by about 4-5 p.c. levels than the corresponding week rates throughout the period 1973-83 as thrown up by the 27th, 32nd and 38th round data. Obviously about 4-5 p.c. of the rural males as well as females classified as having some work in a week do not find work on all the days of the week and remain underutilised. The corresponding proportion for urban males and females vary between 1 p.c. to 2 p.c. during the entire period 1973-1983.

4.7 Regional variation in employment : The level of employment varies from state to state and within a state between rural and urban areas. Though at all-India level not much variation is observed over time, for some states there may be fall or improvement in the employment opportunities over the period under study. Table (5) gives the employment level determined according to the three approaches of measurement as obtained from the 27th, 32nd and 38th round survey data for the various States and Union-Territories. Amongst all the states and union-territories, some improvement in employment level of rural males is observed only for Punjab, West Bengal, Delhi and Meghalaya. In the other states either the employment level has remained almost steady or there has been some deterioration. As regards rural females, some definite improvement is observed for Assam, Bihar, West Bengal and Goa, Daman & Diu. On the other hand for them, deterioration in employment level is observed in Karnataka, Orissa and Rajasthan. For urban males improvement in the employment level is seen in the states of Andhra Pradesh, Gujarat, Haryana, Jammu & Kashmir, Kerala, Madhya Pradesh and Tripura. Similarly, for urban females, of the major states, improvement in the employment level is observed for Kerala, Punjab, Tamil Nadu and West Bengal only.

4.8 Unemployment : As mentioned earlier, for measuring unemployment three estimates have been generated from the survey data of all the three quinquennial surveys undertaken during the 27th, 32nd and 38th round operations. The three estimates are - (i) number of persons usually unemployed; (ii) number of persons unemployed on an average in a week and (iii) number of persons unemployed on an average on a day. The first one will reveal the magnitude of the 'unemployed' during a period of one year judged on the basis of 'relatively longer time' criterion and in that sense may be considered as 'chronically unemployed'. (In the 27th round, a 'chronically unemployed' was one who was not working but was seeking or was available for work for a long past and was likely to be unemployed in the future also). The second one i.e., the rate of unemployment according to current week status, includes both the chronic unemployment which lingered during the reference year and the intermittent or short term unemployment caused due to the fall in labour demand during different seasons of the year of those categorised as usually employed. The third rate reveals the average volume of unemployment on a day taking into account of the days of unemployment of chronically unemployed and usually employed but had some unemployment in a week.

4.9 Chronically unemployed : The estimates of 'chronically unemployed' persons of age 5 years and above in terms of percentages to total population of age 5 years and above by sex and rural-urban residence as obtained from the 27th, 32nd and 38th round data are presented in table (6). It may be noted that in the 32nd and 38th rounds, classification of population was done according to 'time spent' criterion and therefore, those 'marginal workers' who had spent relatively less time on 'work' but had been available for work for a relatively longer time during the reference year, obviously must have been categorised as chronically unemployed. In the 27th round, they might have been classified as 'usually working'. In order to get a complete comparable picture over the three rounds the table also gives the adjusted estimates of chronically unemployed by excluding the marginal workers from the total 'unemployed' for the 32nd and 38th rounds.

Table (6) : Percentage of persons of ^{age}/5 years and above usually (chronically) unemployed as obtained from the three NSS rounds for all-India by sex and residence status

r o u n d*	rural		urban	
	male	female	male	female
	(2)	(3)	(4)	(5)
27	0.75	0.18	2.87	1.00
32 (unadjusted)	1.41	1.68	3.90	3.03
32 (adjusted)	0.83	0.79	3.28	2.52
38 (unadjusted)	1.45	0.51	3.56	2.45
38 (adjusted)	0.97	0.32	3.11	1.05

It is seen that for rural males there has been a slight but steady increase in the chronic unemployment level since the early seventies. For urban males also, there has been a general increase in the unemployment level compared to 1972-73 period. But for them, during early eighties there has been a slight fall in the level compared to the late seventy period. The same trend observed for urban males is seen for females of both the rural and urban areas. The rise in the chronic unemployment ~~xxxx~~ during late seventies and the subsequent fall in the early eighties are but more sharp in their case.

4.10 Current status unemployment rates : Table (7) gives the estimates of 'unemployed' based on the current week status and current day status for the population of ^{age}/5 years and above by sex and rural/urban residence status.

Table (7) : Percentage of 'unemployed' according to current week status and current day status approaches.

r o u n d	ALL-INDIA			
	current week status		current day status	
	male	female	male	female
(1)	(2)	(3)	(4)	(5)
	<u>r u r a l</u>			
27	2.22	2.26	4.75	3.70
32	2.34	1.40	4.45	2.45
38	2.61	1.55	4.79	2.52
	<u>u r b a n</u>			
27	3.53	1.53	4.76	2.04
32	4.06	1.68	5.35	2.11
38	4.04	1.33	5.45	1.72

*27th and 32nd round estimates are based on all the four sub-round data while 38th round estimates are based on only the first two sub-round data.

For rural males the proportion of persons who did not have even an hour's work and were available for work on an average during a period of 7 days was 2.2 p.c. during 1972-73 which remained almost constant for the next five years and then slightly rose to 2.6 p.c. by 1983. It may be noted that in the current week status approach, any person who did even half day's work was considered as employed even if he or she was unemployed for the entire remaining period of the reference week. Taking into account of such unemployment also, it is seen that the level of unemployment on an average during a day was about 4 to 5 p.c. of the total person-days of persons of age 5 years and above during the ten year period beginning in 1972-73, the level remaining almost constant throughout the period. For urban males, the current week status unemployment stood at 3.5 p.c. level during 1972-73 which rose to 4 p.c. level during 1977-78 and then remained stable for the next five years, whereas, the day rate was 4.8 p.c. during 1972-73 rising to 5.4 p.c. during 1977-78 period. For rural females the current status unemployment level appeared to have declined during the 1977-83 period compared to 1972-73. But for urban females the level remained almost constant throughout the ten year period.

4.11 Regional variation in unemployment : Table (8) gives the unemployment rates obtained according to usual status approach, current week status approach and current day status approach for the three periods, 1972-73, 1977-78 and 1983 separately for each state and Union Territories. It also gives adjusted estimates for the latter two years excluding the marginal workers.

Among the major states, Kerala is observed to be having the highest unemployment, the proportion of chronically unemployed during 1983 being nearly 7 p.c. for rural males, 4 p.c. for rural females, 8 p.c. for urban males and 5 p.c. for urban females. Next to Kerala, unemployment is found to be relatively more in the major states of Tamil Nadu and West Bengal (about 2-3 p.c.) for rural males; in Tamil Nadu (2 p.c.) for rural females; in West Bengal (7 p.c.), Tamil Nadu (5 p.c.), Assam, Orissa & Karnataka (4 p.c. each) and Bihar, Gujarat and Haryana (3 p.c. each) for urban males; in West Bengal (about 3 p.c.) and in Assam, Bihar, Himachal Pradesh, Punjab, & Tamil Nadu (about 2 p.c. each) for urban females. The relatively higher current status unemployment rates in Kerala and Tamil Nadu indicate that in those states a good proportion of persons categorised as 'employed' do not find work throughout the year. Even among the persons who have some work in a week, compared to the other States, the proportion of persons who do not find work throughout the week is much higher in Kerala and Tamil Nadu.

Table (68) : Percentage of unemployed to total persons of age 5 years and above according to usual status, current weekly status and current day status during the 27th, 32nd and 38th rounds of NSS

APPENDIX

TABLES*

* The descriptions of the codes used in the tables are :

(a) activity status : as given in page 5.

(b) industry division :

(i) 0 - agricultural sector including hunting,
forestry and fishing.

(ii) 1-9 - all non-agricultural sectors.

LIST OF TABLES

table no.	description	pages
(1)	(2)	(3)
1.	Distribution of population of age 5 years and above by activity status (usual, current week & current day) and sex	31 - 88
2.	Percentage distribution of workers (main, marginal & all) by industry division	89 - 119

[The current week and day status estimates presented in Table (1) relate to the same period 'January to June' respectively of the years 1973 (for 27th round), 1978 (for 32nd round) and 1983 (for 38th round)].

Table (1) : Distribution of population of age 5 years & above by activity status (usual, current week & current day) and sex.
