P R E F A C E

The National Sample Survey Organisation (NSSO) has been conducting enquiries on Household Consumer Expenditure and Employment & Unemployment once in every five years under its ten-year programme. The third quinquennial survey in the new series on household consumer expenditure was conducted during the 38th round (January - December 1983).

The results on the level of nutritional intake of population distributed over different expenditure classes as estimated from the 38th round survey on consumer expenditure has already been released through NSS report no. 353. Likewise, the results on the effect of adjustment of energy intake for meals consumed free and meals served to others have been released through NSS report 356. In this report, the distribution of households and persons over monthly per capita expenditure classes is given for different calorie intake levels for each state/u.t. and for all-India.

I wish to express my thanks to Shri S. Banerjee, Joint Director, Shri S. K. Giri, Deputy Director and Shri Prabir Choudhury, Assistant Director of SDRD who were intimately associated with the writing of this report. It would not have been possible to prepare this report but for the special tabulations done by the officers and staff of Computer Centre with top priority. Any comments/suggestions for improvement of this report are welcome.

Section One

INTRODUCTION

1.0 The National Sample Survey Organisation (NSSO) has been conducting enquiries on Household Consumer Expenditure and Employment and Unemployment once in every five years under its ten-year programme. The third quinquennial survey in the new series on household consumer expenditure was conducted during the 38th round (January 1983 to December 1983). The first two such quinquennial surveys were undertaken during the 27th round (July 1972 to June 1973) and 32nd round (July 1977 to June 1978). The results on intake of nutrients as estimated from the 38th round survey on consumer expenditure has already been released through NSS report no. 353. Likewise, the results on effect of adjustment of energy intake for meals consumed free and meals served to others have been released through NSS report no. 356. In this report, the distribution of households and persons over monthly per capita expenditure classes is given for different calorie intake levels for each state/u.t. and for all-India.

1.1 In order to arrive at the necessary estimates, households were classified according to i) level of per capita monthly expenditure and (ii) level of calorie intake per consumer unit per day (see definition of "consumer unit" in section two). The calorie intake for a sample household was derived by converting the quantities of the items of food consumed by the household into equivalent amounts of calories by using standard conversion factors.^{1/} The level of calorie intake per day per consumer unit was similarly derived by aggregating the total calories thus calculated for all the food items consumed by the sample household during the last 30 days preceding the day of enquiry and finally dividing this aggregate by the number of consumer units in the household multiplied by 30.

^{1/} Nutritive Value of Indian Foods ; Indian Council of Medical Research (1978).

1.2 SURVEY PERIOD AND REFERENCE PERIOD : The field work of the 38th round survey was carried out during the calendar year 1983 starting from January and continuing upto December - thus covering a period of complete year. The data collected on household consumer expenditure with a moving reference period of 30 days preceding the day of enquiry and thus the results presented in this report relate to the period from December 1982 to December 1983.

1.3 COVERAGE : The geographical coverage of the survey was extended over the whole of rural and urban areas of the Indian Union excepting Ladakh and Kargil districts of Jammy & Kashmir and rural areas of Nagaland.

1.4 SAMPLE SIZE : The survey covered about 1,17,423 sample households spread over 7803 villages and 4138 urban blocks. The number of sample villages/blocks allotted and surveyed in different states is laid out in Table (S.0). It is seen from this table that in Meghalaya, Sikkim, Tripura, Arunachal Pradesh and Lakshadweep quite a large proportion of the sample remained unsurveyed. Because of this, the results of the survey may not reflect the real situation obtaining in these states. Hence, the results of these states are not presented separately in the report. They are, however, included in the all-India estimate.

1.5 PARTICIPATION OF STATES : In the 38th round survey, all the states and Union territories (included in the geographical coverage) except Andaman & Nicobar Islands, Chandigarh, Dadra and Nagar Haveli and Lakshadweep participated in the survey on at least equal matching basis. The results presented in this report are, however, based on the data of the central sample only.

1.6 CONTENTS OF THE REPORT : The report contains tables separately for rural and urban sectors in respect of states and union territories of India and for all-India. In addition to these tables, three sections besides this one, viz. the report contains, Concepts and Definitions ; Sampling Design and Estimation Procedure ; and a Summary of Findings.

Section Two

CONCEPTS AND DEFINITIONS

2.0 The concepts and definitions followed in household consumer expenditure survey during the 38th round have broadly remained the same as in previous NSS rounds. Those relevant for this report are given below.

2.1 HOUSEHOLD : A household is a group of persons normally living together and taking food from a common kitchen. A boarding house, a hotel or a hostel is treated as a cluster of households, where, each individual boarder forms a separate household. Households maintained and provided for directly by government, such as those in prisons, police quarters, cantonments, hospitals, asylums and relief camps are, however, excluded from the scope of the survey.

2.2 HOUSEHOLD SIZE : The total number of members in a household is called the household size.

2.3 CONSUMER UNIT : This is a unit of calorie requirement. Calorie requirements are known to differ for persons in different age-sex categories. As a result, "number of persons" does not give a very good idea of the total calorie requirement of a group of persons. To make it possible to get a better idea of this calorie requirement, nutritionists assign a person a "number of consumer units" depending on his/her age and sex, which expresses his/her calorie requirement as a proportion of the requirement of a "reference man".

sex	number of consumer units assigned to a person											
	age in completed years											
<1	1-3	4-6	7-9	10-12	13-15	16-19	20-39	40-49	50-59	60-69	>70	
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)	(11)	(12)	(13)
male	.43	.54	.72	.87	1.03	.97	1.02	1.00	.95	.90	.80	.70
female	.43	.54	.72	.87	.93	.80	.75	.71	.68	.64	.51	.50

2.4 HOUSEHOLD CONSUMER EXPENDITURE : Household consumer expenditure comprises all expenditure incurred by a household exclusively on domestic account, including consumption out of home-grown produce or transfer receipts like gift, loan etc. The expenditure on household enterprise is excluded from consumer expenditure. While consumption out of transfer receipts is included, transfer payments of all kinds (loans, gifts, charities, cash as well as in kind, e.g. grain loan etc.) are excluded.

Expenditure on purchase and construction of residential houses is considered to be on capital account and therefore, is kept outside the purview of consumer expenditure; but expenditure towards repair and maintenance of residential buildings is included in the consumer expenditure of the household. Monetary value of food items consumed during the reference period is taken to represent consumer expenditure on food items. This ^{HOD} also includes consumption of food articles in ceremonies performed in the household during the reference period. While quantity consumed by domestic animals like cattle etc. are not included under domestic consumption, consumption of pet animals like cats, dogs, birds etc. are included. For semi-durable and durable goods and also miscellaneous goods & services, the actual expenditure incurred towards purchase of these articles during the reference period is considered as the consumer expenditure of the household. For items of clothing and footwear the monetary value of the articles brought into first use during the reference period is taken as the consumer expenditure on the articles concerned.

2.5 MONTHLY PER CAPITA EXPENDITURE (MPCE) : For a household, this is the ratio of total household consumer expenditure during a period of 30 days to the household size.

2.6 REFERENCE PERIOD : The reference period used for household consumer expenditure surveys is a moving one in the sense that this period is always linked with the day of enquiry. For all items of consumer expenditure the reference period is the last 30 days preceding the day of enquiry. For items of clothing, footwear and durable goods data were also collected for a reference period of last 365 days preceding the day of enquiry. The data presented in this report are, however, based on the reference period of last 30 days only.

2.7 CALORIE : This is a unit for measuring energy. The calorie unit of measurement of nutrient in food is 1000 times the conventional "calorie" unit of energy. Hence in some studies, the unit of nutrient has been expressed as "KCal" (i.e. kilo calories or 1000 calories) or simply "Cal" (Calorie).

2.8 "NORM" LEVEL OF CALORIE INTAKE : To say that age and sex determine calorie requirement is a simplification of the real situation, since calorie requirements depend on various other factors such as body weight, nature of work, state of health and so on. Thus the calorie intake per consumer unit is really not a fixed amount but varies with those factors. Nutritionists, attempting to assess calorie requirements per consumer unit, differ in their approaches to the problem, some specifying calorie requirement as a function of body weight, while others assign requirements depending on nature of work (sedentary/moderate/heavy). Since the 26th Round, the NSS has been using the level of 2700 calories per consumer unit as a standard against which actual observed calorie intakes may be compared. In this report this level (2700 calories per consumer unit) is referred to as the "norm" level of calorie intake.

Section Three

SAMPLE DESIGN AND ESTIMATION PROCEDURE

3.0 SAMPLING DESIGN : The sampling design adopted in the 38th round survey was a two-stage stratified one with census villages in the rural areas and Urban Frame Survey (UFS) blocks in the urban areas as first stage units and households as second stage units. The sample villages were selected with probability proportional to size and with replacement in the form of two independent interpenetrating samples while the sample blocks were selected with equal probability also in the form of two independent interpenetrating samples. After arranging all households of a selected first stage unit in a specified manner ten sample households were selected from them following a circular systematic sampling design.

3.1 SAMPLING FRAME : The sampling frame for the rural areas was the list of villages as per 1981 decennial population census except for Assam where 1971 census list of villages had been used. For the urban areas, the list of Urban Frame Survey (UFS) blocks was used as sampling frame.

3.2 SURVEY PERIOD AND SUB-ROUND FORMATION : The survey started from January 1983 and continued up to December 1983. The entire survey period of one year was divided into four sub-rounds each of three months duration as follows :

January 1983 to March 1983 : sub-round 1
April 1983 to June 1983 : sub-round 2
July 1983 to Sept. 1983 : sub-round 3
and October 1983 to Dec. 1983 : sub-round 4

The sample was equally distributed over the four sub-rounds in a manner so as to provide equally valid estimates for each quarter of the year. This would ensure that the averages based on the pooled data for all the sub-rounds taken together were free from seasonal effects.

3.3 ESTIMATION PROCEDURE : The estimation procedure adopted in the 38th round is based on weighted sums of sample values. Denoting by \hat{Y} the unbiased estimate of Y (the state total of any variate), one obtains

$$\hat{Y} = \sum_s \frac{P_s}{n_s} \sum_i \frac{D_{si}}{p_{si} e_{si}} \cdot \frac{H_{si}}{h_{si}} \sum_j Y_{sij} \dots \dots (1) \text{ for rural sector}$$

and

$$\hat{Y} = \sum_s \frac{N_s}{n_s} \sum_i D_{si} \cdot \frac{H_{si}}{h_{si}} \sum_j Y_{sij} \dots \dots (2) \text{ for urban sector}$$

where, s, i and j stand for stratum, village/urban block and household respectively;

HDB

P_s , N_s , and n_s denote the population, number of blocks in the frame and number of sample villages/blocks for the s th stratum respectively;

D_{si} , e_{si} and p_{si} denote the number of hamlet groups/sub-blocks formed, number of census villages contained in a large revenue village and the population for the i th sample village in the s th stratum respectively;

H_{si} and h_{si} stand for total number of households listed and number of sample households for the i th sample village/block in the s th stratum respectively; and finally Y_{sij} is the observed value of the variate for the j th sample household in the i th sample village/block of the s th stratum. The estimate of a ratio of two characteristics is given by the ratio of the estimates of their aggregates.

HDB

HDB

Section Four
SUMMARY FINDINGS

- 4.0 It was explained in Section Two that calorie intake levels have been expressed in this report as percentages of a "norm" requirement of 2700 calories per consumer unit (hereafter PCU) per day. Thus in the state/U.T. level distributions of estimated persons and households by calorie intake level per consumer unit, the unit of calorie intake level is not "calories PCU per day" but "per cent of norm". To illustrate, the calorie intake class 70-80 in Table (S.1R), means a range of PCU calorie intake per day from 70% of 2700 to 80% of 2700. Keeping this in mind we may proceed to examine, first, Tables (S.1R) and (S.1U), which give, respectively, rural and urban state/U.T. level distributions of persons by PCU calorie intake level per day. Eight PCU calorie intake classes have been used in presenting the estimated distributions. In the discussion which follows, the term "major states" refers to the following states of India : Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Himachal Pradesh, Jammu & Kashmir, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal.
- 4.1 In both rural and urban sectors the majority of the population in practically every state/U.T. have PCU calorie intake between 70% and 120% of the norm. Nearly all major states have 500 to 650 out of every 1000 rural persons in this calorie intake range, as well as 550 to 700 of every 1000 urban persons.
- 4.2 In most of the states the urban areas have proportionately more persons in the lowest PCU calorie intake classes than the rural areas. For almost all the major states, it is in fact true to say that given any particular PCU calorie intake level, the proportion of urban persons below that level is generally greater than the proportion of rural ^{persons} below the same level. The all India average number of persons below 80% of the PCU intake norm is 357 per 1000 for the urban sector compared to 278 for the rural sector. About one-half of the urban population of most major states have calorie intake less than 90% of the norm compared to around 400 out of 1000 persons in rural areas. From the distributions presented, it can be seen that at the all-India level every calorie intake class below the norm (i.e., the 100% level) includes a higher proportion of urban population than the proportion of rural population; the reverse is true for classes above the norm.

Mizoram	84	111	144	287	190	85	106	43	1000	1938	
Fondicherry	333	171	79	106	95	65	72	79	1000	683	
All-India	210	147	163	144	107	74	104	51	1000	98498	

The all-India average number of persons below the norm is 664 out of 1000 for the urban sector compared to 538 for the rural.

4.3 In rural areas of Tamil Nadu and Kerala, more than 700 out of 1000 persons have PCU calorie intake level below the norm and around 350 of these are in fact below the 70% level. More than 600 out of 1000 are below the norm in rural West Bengal, Assam and Gujarat. (The all-India rural average is 538.) The better-off-major states (rural) are Himachal Pradesh, Jammu & Kashmir, Punjab and Haryana with more than 600 out of 1000 persons having intake levels above the norm.

4.4 In the urban sector the largest numbers of persons per 1000 in the low calorie intake ranges are found in Tamil Nadu with Gujarat, West Bengal, Kerala and Assam following. In sharp contrast to the rural sector, where there are several major states having more than 250 out of 1000 persons above the 120% level of PCU calorie intake, there are only two such states-Haryana and Himachal Pradesh-in the urban sector. Striking rural-urban differences are visible in Punjab, where the median calorie intake can be seen to be nearly 120% of the norm in the rural sector compared to barely 100% in the urban, and Uttar Pradesh. Practically the only major state with a better-off urban sector compared to the rural in terms of PCU calorie intake seems to be Orissa.

4.5 The state/U.T. level distributions of households by PCU calorie intake level (Table (S.2R) and (S.2U)) have the same features as the corresponding distributions of persons. The lower calorie intake classes tend to have slightly smaller proportions of households than persons, which is as it should be considering that larger household sizes depress the PCU calorie intake level. At the all-India level 500 out of 1000 rural households (compared to 538 out of 1000 rural persons) have PCU calorie intake below the norm (100% level). Likewise 582 out of 1000 urban households (compared to 664 out of 1000 urban persons) have PCU calorie intake below the norm.

4.6 One may next take up the distributions of persons and households by monthly per capita expenditure (MPCE) classes and state/union territory. These distributions might throw some light on the patterns of calorie intake already observed. To begin with, one may examine the MPCE distributions of persons/households as such without reference to calorie intake levels.

Table (S.2R) : Per 1000 distribution of households by per consumer unit calorie intake level for each state/u.t.

- 4.7 Table (S-3B) shows that for the rural sector, the MCE distributions of persons tend to cluster within the range of Rs. 60 to Rs. 125. For most states more than 500 out of every 1000 persons fall within this range. Typically the poorer states have median MCE in the Rs. 85-100 range and the comparatively better-off states in the Rs. 100-125 range. Bihar and Madhya Pradesh have more than half the rural population below the Rs. 85 level of MCE while for Punjab and Himachal Pradesh more than half the rural population are above the Rs. 125 mark.
- 4.8 In urban areas MCE's are somewhat higher than in rural areas, as Table (S-3U) shows. In most states more than 500 out of 1000 persons have MCE between Rs. 70 and Rs. 150, while another 150 to 200 persons lie in the Rs. 15-20 range. The better-off states have median MCE between Rs. 125 and Rs. 150 while for poorer states the median MCE is between Rs. 100 and Rs. 125. For Himachal Pradesh the median MCE exceeds Rs. 150.
- 4.9 Going on to Tables (S.4A) and (S.4B), one finds that the state/U.T. wise rural and urban distributions of households by MCE differ little from the corresponding MCE distributions of persons.
- 4.10 It remains to see whether the inter-sector and inter-state differences in PCU calorie intake level distributions can be traced to differences in MCE distributions among sectors and states. For this purpose it will suffice to consider the personwise distributions as the householdwise distributions more or less tell the same story.
- 4.11 The first point is that the sectoral differences in PCU calorie intake level distributions whether at state or all-India level, do not appear to be explainable by MCE differences among sectors. It was observed (see 4.2 above) that for nearly every state, the proportion of persons below any particular calorie intake level is larger in urban areas than in rural areas. This could be explained in terms of MCE if it were found that the proportion of persons below a particular MCE level, too, is in general greater in urban than in rural areas. But clearly, the reverse is true for most states.

At the all-India level, one may observe that each MPC class below the Rs. 100 level shows a larger number of persons per 1000 in the rural than in the urban sector. Even at the state level the same phenomenon may be observed if slightly broader MPC classes are considered.

4.12 It is to how far inter-state differences in PCU calorie intake are rooted in MPC or overall-level-of-living differences, the evidence seems to be somewhat mixed. One may take up the rural sector first. It is quickly seen from Table (S.1R) and Table (S.3.) that a state with low calorie intakes may or may not be a state of low MPCs. For rural India, Bihar is an 'average' state in terms of PCU calorie intake distribution of persons (i.e., the distribution for Bihar is similar to the all-India distribution), but one of the poorest states in terms of MPC levels. Kerala - again considering the rural sector only - is a comparatively well-off state in terms of MPC but has a very low-calorie-intake population compared to the rest of India. One can go on to list many observations on inter-state differences in rural calorie intake levels which are not explainable in terms of MPC differences. On the other hand, Punjab and Himachal Pradesh, states with high rural calorie intake PCU, are also the states with high rural MPC levels and to some extent this is also true of Jammu & Kashmir and Haryana. However, it is really the low-MPC ranges of a state where one would expect calorie intakes to be influenced by MPC rather than the high-MPC ranges, and evidence of such influence is scanty.

4.13 Coming to the urban sector, one again finds no "MPC basis" for the very low calorie intake levels of Gujarat and Assam, for even of Kerala and West Bengal. Nor is the very large number of persons (373 per 1000 in Tamil Nadu below the 70% of-the-norm calorie intake level compared to, say, 156 per 1000 in Bihar and 108 per 1000 in Orissa, explained in terms of MPC.^{1/} One can give many such examples. In the whole, therefore, one fails to account for inter-state calorie intake differences in terms of MPC differences among states, and this is true for both rural and urban sectors.

1/ For suppose one assumes that among 1000 persons from urban Tamil Nadu those 373 are the poorest 373 in terms of MPC and consequently cannot, in general, afford a food basket giving them even 70% of the norm requirement of calories. Now Table (S.3U) shows that the poorest 373 of every 1000 persons occupy a range of MPC extending from 0 to beyond Rs. 100. If in a given large, heterogeneous calorie intake then in any state, "less than Rs. 100" should imply (roughly, and subject to inter-state price differences) "PCU calorie intake less than 70%". But, again from Table (S.3U), Bihar and Orissa have, respectively 40 and 310 persons per 1000 in the Rs. 0-100 MPC's range, and only 156(Bih) and 108(Orissa) have PCU calorie intakes below 70% of the norm.

4.15 The findings, so far, may be summarised as follows : (1) the proportions of persons in the lower calorie intake ranges are somewhat higher in urban areas than in rural areas of nearly all major states; (2) this is in spite of the fact that there are proportionately more rural persons than urban persons in the low-MPCE ranges in nearly every state; (3) statewise differences in PCU calorie intake distributions, including marked differences in the lower calorie intake ranges, exist in both rural and urban sectors of India; (4) but these differences are difficult to explain in terms of MPCE or level-of-living differences among states/U.T.s.

4.16 One may hypothesise regarding findings (1) and (2) that in the urban areas the food component of household MPCE is low compared to rural areas. (3) and (4) seem to suggest that different states have their own peculiar patterns of food consumption historically determined by agricultural and other factors and this, rather than purchasing power, is what largely determines their calorie intake levels.
