

# CHAPTER SIX

Water

## CHAPTER SIX

# WATER

6.1 India is rich in surface water resources. Average annual precipitation is nearly 4000 cubic km. and the average flow in the river system is estimated to be 1880 cubic km. Because of concentration of rains only in the three monsoon months, the utilizable quantum of water is about 690 cubic km. However, conditions vary widely from region to region. Whereas, some regions are drought affected, others are frequently flooded. With the rapid increase in the population, the demand for irrigation, human and industrial consumption of water has increased considerably, thereby causing depletion of water resources. The assumption that "Fresh water is a gift of God which would continue to be available in perpetuity and in abundance" is under challenge. The main preoccupation of water resources development in the country is the extension and improvement of irrigation and hydel power generation. Water requirements for industrial and domestic use are met partly from reservoirs constructed and managed by the irrigation department. The agriculture production technologies have put a lot of stress on underground water resources.

### River Water

6.2 Rivers are the lifeline of majority of population in cities, towns and villages and most of these are considered as sacred. Every river stretch has a distinct water use like bathing, drinking, municipal supply, navigation, irrigation and fishing, sports, etc. Simultaneously, it is also used as receptacle for discharge of industrial effluent, municipal sewage and dumping of solid wastes. The Water (Prevention and Control of Pollution) Act, 1974 is aimed to support the quality

of various designated best uses of water bodies. The Water Quality Atlas of the Indian River System has been prepared by CPCB on the basis of five major uses of the river water such as:

- (a) Drinking water source without conventional treatment but after disinfection;
- (b) Outdoor bathing organized;
- (c) Drinking water source but with conventional treatment followed by disinfection;
- (d) Propagation of wildlife, fisheries;
- (e) Irrigation, industrial cooling, controlled waste disposal.

For maintaining the quality of river water, the pollution levels in rivers have been detected by monitoring limited number of the physico-chemical parameters, which could only determine the changes in chemical characteristics of water bodies. Deterioration in water quality, over the past several years has gradually rendered the river water quality unsuitable for various beneficial purposes.

### Monitoring of Rivers

6.3 The Central Pollution Control Board in collaboration with State Pollution Control Board is operating the Water Quality Monitoring Network comprising of 784 stations in 26 States and 5 Union Territories spread over the country for monitoring of aquatic resources. The monitoring is undertaken on monthly/quarterly basis in surface water and half yearly basis in cases of groundwater. The monitoring network covers 168 rivers, 53 lakes, 5 tanks, 2 ponds, 3 creeks, 3 canals, 12 drains and 181 groundwater wells. This is done through three major schemes 1) Global

Environmental Monitoring System (GEMS)- 2) Monitoring of Indian National Aquatic Resources (MINARS) - and 3) Yamuna Action Plan (YAP)

6.4 The monitoring results obtained during year 2003 indicate that organic pollution continues to be the predominant form of pollution of aquatic resources. The organic pollution measured in terms of bio-chemical oxygen demand (BOD) & coliform count gives the indication of extent of water quality degradation in different parts of country. It is observed 67% of the observations, out of nearly 3000 observations are having BOD less than 3 mg/l, 18% between 3-6 mg/l & 15% above 6 mg/l. Similarly Total & Faecal coliform, which indicate presence of pathogens in water, are also of major concern. About 45% observations are having Total coliform and 58% observations are having Faecal coliform less than 500 MPN/100 ml.

### **Biological Water Quality Evaluation and Criteria**

6.5 There are two methods adopted for water quality evaluation which are complementary to each other.

#### **1. Saprobiic Score (BMWP)**

This methodology involves inventory of the presence of benthic macro-invertibrate fauna up to the family level with the taxonomic precision. All possible families having saprobiic indicator value are classified on score scale of 1 to 10 according to their preference for saprobiic water quality. The saprobiic scores of all the families are registered and averaged to produce BMWP score.

#### **2. Diversity Score (Sequential Comparison)**

This method involves pairwise comparison of sequentially encountered individuals and the difference of two benthic animals can be observed upto the species level, where no taxonomic skill is required. The diversity is the ratio of total no. of different animals (runs) and the total number of organisms encountered. The ratio of diversity has a value between 0 and 1.

### **Water Pollution**

6.6 The types and sources of water contamination include “point” sources of pollution which usually refers to wastes being discharged from a pipe; and “non point” sources, which means all other sources such as storm water runoff (which picks up oils and other contaminants from various areas), irrigation (which carries fertilizers and pesticides into groundwater), leaks from storage tanks and leakage from disposal sites. The non-point sources are technically the most difficult to regulate in India. Water pollution comes from three main sources: domestic sewage, industrial effluents and run-off from activities such as agriculture. Water pollution from domestic and human wastewater causes many severe water borne diseases. The problem of water pollution due to industries is because of the inadequate measures adopted for effluent treatment than to the intensity of industrial activities. The 13 major water polluting industries have been identified and are closely monitored by the Central Pollution Control Board.

6.7 Access to safe drinking water remains an urgent need as about 70.5% of the households in the urban area and 8.7 % in rural areas receive organized piped water-supply and the rest have to depend on surface or ground water which is untreated. The diseases commonly caused due to contaminated water are diarrhea, trachoma, intestinal worms,

hepatitis, etc. The most common contamination in the water is from the disease bearing human wastes, which is usually detected by measuring fecal coliform levels. Inadequate access to safe drinking water and sanitation facilities leads to higher infant mortality and intestinal diseases.

6.8 An uncontrolled disposal of urban waste into water bodies, open dumps and poorly designed landfills, causes contamination of surface water and ground water. For industries, surface water is the main source for drawing water and discharging effluents. Industrial wastes containing heavy metals such as mercury, chromium, lead and arsenic can threaten or destroy marine life besides polluting aquatic food resources.

## GROUND WATER

MCM/yr : Million Cubic Metre/Year

Out of the total replenishable ground water; about 84% is made available for agriculture and livestock, the rest 16% is made available for domestic consumption, industrial use and power generation. However, not all the water abstracted is effectively used. There are sizeable losses in conveyance and application of irrigated water. A large part of water used by industry and domestic purposes is returned to the streams as effluent waste; and most of the water drawn by power station is used for cooling purposes and is available for reuse.

The water pollution in India comes from three main sources : domestic sewage, industrial effluents and run off from activities such as agriculture. Major industrial sources of pollution in India include the fertilizer plants, refineries, pulp and paper mills, leather tanneries, metal plating and other chemical industries.

1	Drinking WaterSource without Conventional Treatment but after Disinfection	A	1 Total Coliforms Organised MPN/100ml shall be 50 or less 2 pH between 6.5 & 8.5 3 Dissolved Oxygen 6mg/l or more 4 Biochemical Oxygen Demand 5 days 20°C 2mg/l or less.
2	Outdoor bathing (organised)	B	1 Total Coliforms Organism MPN/100ml shall be 500 or less 2 pH between 6.5 & 8.5 3 Dissolved Oxygen 5mg/l or more 4 Biochemical Oxygen demand 5 days 20°C 3mg/l or less.
3	Drinking Water Source	C	1 Total Coliforms Organism MPN/100ml shall be 5000 or less 2 pH between 6 & 9 3 Dissolved Oxygen 4mg/l or more 4 Biochemical Oxygen demand 5 days 20°C 3mg/l or less.
4	Propagation of Wild Life	D	1 pH between 6.5 & 8.5 Fisheries 2 Dissolved Oxygen 4mg/l or more 3 Free Ammonia ( as N ) 1.2 mg/l or less
5	Irrigation, Industrial Cooling, Controlled Waste	E	1 pH between 6.0 or 8.5 2 Electrical conductivity at 25°C Micro mhos/cm Max 2250. 3 Sodium Absorption Ratio, Max 26 4 Boron, Max 2mg/l

Source : Water Quality - Status & Statistics (1996 & 1997), Central Pollution Control Board

The water quality at any location is determined as the one which is satisfied at least 80% of time by all the criteria parameters. To further elucidate on this if at a location, 80% of the time Dissolved Oxygen, pH were in the range specified for class A, BOD for class B and total coliforms for class C, then the existing status is determined as C.

**TABLE 6.2.1: MAIN ACTIVITIES ALONG THE INDIAN COASTAL ZONE**

1	2
<b>Land Based :</b>	
I. Coast dependent	Ports & Harbours Oil Terminals Paper & Pulp mills Metallurgical Plants Fish Processing Power Plants
II. Coast preferring	Urban, commercial & residential development Tourism & beach recreation Agriculture
III. Coast independent	Defence
<b>Water based</b>	Offshore oil and gas Offshore placer mining Navigation Naval defence Water sports Fishing

Source : The State of Environment, 1995, Ministry of Environment & Forests

Coastal areas are of enormous socio-economic importance, because of both their traditional resources viz. fish, tourist potential, commercial and residential development as well as the new types of resources using new technologies such as ocean thermal energy, wave energy, offshore mineral deposits, mariculture etc. The high economic value of these areas and the relative fragility and vulnerability to natural hazards, sea level rise and anthropogenic activities make the preservation and the management of coastal zone resources and its environment of enormous importance.

**TABLE 6.2.2 : POLLUTANTS AND THEIR IMPACTS ON THE MARINE ENVIRONMENT**

<b>Sl. No.</b>	<b>Sources</b>	<b>Impacts</b>
<b>1</b>	<b>2</b>	<b>3</b>
1	Municipal and Domestic Waste	Reduce dissolved oxygen (DO); increase hydrogen sulphide levels; incidence of faecal coliform & faecal streptococci; high biological oxygen demand (BOD)
2	Industrial Waste	Affect DO, temperature, turbidity, pH, ammonia values; increases BOD, COD, suspended solids
3	Toxic Metals	Cause change in chemical and biochemical processes, increase in turbidity, lethal and sublethal effects on marine life
4	Oil Pollution	Causes smothering, clogging and toxicity
5	Fertilizers	Affect nutrient levels and may cause eutrophication
6	Dredging & Reclamation	Affect habitats of marine organisms; lethal and sublethal effects; affects flushing capacity of the waterbody
7	Siltation	Increases in nutrient levels and can cause excessive algal bloom; may also cause damage to coral reefs and coastal nurseries
8	Discharge of Coolant Waters	Raises the temperature of the water can cause the growth of the blue-green algae
9	Toxic Chemicals	Cause lethal and sublethal effects on marine organisms
10	Offshore Mining	Increases particulate loading which can lead to loss of light and reduced primary productivity ; smothering and clogging of benthic communities
11	Radionuclides	Bioaccumulation in fish and other benthic communities

**TABLE 6.2.3 : "POTENTIAL HOTSPOTS" ALONG THE INDIAN COAST**

<b>Sl. No.</b>	<b>States</b>	<b>Coastal Cities/ Towns</b>
<b>1</b>	<b>2</b>	<b>3</b>
1	Gujarat	Okha, Veraval
2	Maharashtra	Bassein, Bombay Harbour, Thane, Trombay, Versova, Ulhas creek, Mahim
3	Goa	Marmagoa
4	Karnataka	Karwar, Mangalore
5	Kerala	Kochin, Thiruvananthapuram
6	Tamil Nadu	Ennore, Madras Harbour, Cooum, Port Calimere, Koodankulam, Arumuganeri, Tuticorin
7	Andhra Pradesh	Vishakhapatnam
8	Orissa	Gopalpur, Paradip, Puri
9	West Bengal	Indo-Bangladesh border, Sandheads, Diamond Harbour

Source: State of the Environment, 1995

Pressures on the marine environment arise from both natural as well as anthropogenic activities. The latter occurs either due to overexploitation of coastal and marine resources or due to the use of the coastal and marine environment as sinks of pollutants and other wastes arising as by-products of development activities. There are various such sources of marine pollution, their impacts varying according to the nature of the coastal or marine environment impacted upon and on the nature of the pollutant itself.

Marine population occurs off most metropolitan cities and densely populated coastal towns in India, but there are 25 heavily polluted potential 'hot spots' along the Indian coast.

**TABLE 6.2.4 : CRITERIA FOR CLASSIFICATION OF INLAND SURFACE WATER**

Sl. No.	Parameter	Maximum / Minimum	Drinking Water without Conventional Treatment but after Disinfection	Outdoor Bathing Organized	Drinking Water with Conventional Treatment Followed by Disinfection	Propagation of Wildlife and Fisheries	Irrigation, Industrial, Cooling etc.
1	2	3	4	5	6	7	8
1	Dissolved oxygen (mg/litre)	Minimum	6	5	4	4	-
2	Biological oxygen demand (mg/litre)	Minimum	2	3	3	-	-
3	Total coliform bacteria (most probable number per 100 millilitres)	Maximum	50	500	5000	-	-
4	Total dissolved solids (mg/litre)	Maximum	500	-	1500	-	2100
5	Chloride as chlorine (mg/litre)		250	-	600	-	500
6	Colour (hazen)	Maximum	10	300	300	-	-
7	Sodium absorption ratio	Maximum	-	-	-	-	26
8	Boron (mg/litre)	Maximum	-	-	-	-	2
9	Sulphates (mg/litre)	Maximum	400	-	400	-	1000
10	Nitrates (mg/litre)	Maximum	20	-	50	-	-
11	Free ammonia as nitrogen (mg/litre)	Maximum	-	-	-	12	-
12	Conductivity at 25°C(µs/cm)	Maximum	-	-	-	1	2.25
13	PH	-	6.5-8.5	6.5-8.5	6.5-8.5	6.5-8.5	6.0-8.0
14	Arsenic (mg/litre)	Maximum	0.05	0.2	0.2	-	-
15	Iron (mg/litre)	Maximum	0.3	-	50	-	-
16	Fluorides (mg/litre)	Maximum	1.5	1.5	1	-	-
17	Lead (mg/litre)	Maximum	0.1	-	0.1	-	-
18	copper (mg/litre)	Maximum	1.5	-	1.5	-	-
19	Zinc (mg/litre)	Maximum	15	-	15	-	-
